What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

| Details	
Product Status	Active
Core Processor	MIPS32® M4K™
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	CANbus, Ethernet, I²C, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	85
Program Memory Size	512KB (512K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	64K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mx775f512l-80v-pf

1.0 DEVICE OVERVIEW

Note: This data sheet summarizes the features of the PIC32MX5XX/6XX/7XX family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the documents listed in the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

This document contains device-specific information for PIC32MX5XX/6XX/7XX devices.

Figure 1-1 illustrates a general block diagram of the core and peripheral modules in the PIC32MX5XX/6XX/7XX family of devices.

Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

FIGURE 1-1:   BLOCK DIAGRAM[(1,2)]

Note 1: Some features are not available on all devices.
  2: BOR functionality is provided when the on-board voltage regulator is enabled.

2.0 GUIDELINES FOR GETTING STARTED WITH 32-BIT MCUS

Note: This data sheet summarizes the features of the PIC32MX5XX/6XX/7XX family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

2.1 Basic Connection Requirements

Getting started with the PIC32MX5XX/6XX/7XX family of 32-bit Microcontrollers (MCUs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see **2.2 "Decoupling Capacitors"**)
- All AVDD and AVSS pins even if the ADC module is not used (see **2.2 "Decoupling Capacitors"**)
- VCAP pin (see **2.3 "Capacitor on Internal Voltage Regulator (VCAP)"**)
- MCLR pin (see **2.4 "Master Clear (MCLR) Pin"**)
- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see **2.5 "ICSP Pins"**)
- OSC1 and OSC2 pins when external oscillator source is used (see **2.8 "External Oscillator Pins"**)

The following pin may be required, as well: VREF+/VREF- pins used when external voltage reference for ADC module is implemented.

Note: The AVDD and AVSS pins must be connected, regardless of the ADC use and the ADC voltage reference source.

2.2 Decoupling Capacitors

The use of decoupling capacitors on power supply pins, such as VDD, VSS, AVDD and AVSS is required. See Figure 2-1.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A value of 0.1 µF (100 nF), 10-20V is recommended. The capacitor should be a low Equivalent Series Resistance (low-ESR) capacitor and have resonance frequency in the range of 20 MHz and higher. It is further recommended to use ceramic capacitors.

- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended that the capacitors be placed on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.

- **Handling high frequency noise:** If the board is experiencing high frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 µF to 0.001 µF. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 µF in parallel with 0.001 µF.

- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB track inductance.

Note 1: All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.1.1 "CLR, SET and INV Registers"** for more information.

2: DMA channels 4-7 are not available on PIC32MX534/564/664/764 devices.

11.0 USB ON-THE-GO (OTG)

Note:	This data sheet summarizes the features of the PIC32MX5XX/6XX/7XX family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 27. "USB On-The-Go (OTG)"** (DS60001126) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Universal Serial Bus (USB) module contains analog and digital components to provide a USB 2.0 full-speed and low-speed embedded Host, full-speed Device or OTG implementation with a minimum of external components. This module in Host mode is intended for use as an embedded host and therefore does not implement a UHCI or OHCI controller.

The USB module consists of the clock generator, the USB voltage comparators, the transceiver, the Serial Interface Engine (SIE), a dedicated USB DMA controller, pull-up and pull-down resistors, and the register interface. A block diagram of the PIC32 USB OTG module is presented in Figure 11-1.

The clock generator provides the 48 MHz clock required for USB full-speed and low-speed communication. The voltage comparators monitor the voltage on the VBUS pin to determine the state of the bus. The transceiver provides the analog translation between the USB bus and the digital logic. The SIE is a state machine that transfers data to and from the endpoint buffers and generates the hardware protocol for data transfers. The USB DMA controller transfers data between the data buffers in RAM and the SIE. The integrated pull-up and pull-down resistors eliminate the need for external signaling components. The register interface allows the CPU to configure and communicate with the module.

The USB module includes the following features:

- USB Full-speed support for host and device
- Low-speed host support
- USB OTG support
- Integrated signaling resistors
- Integrated analog comparators for VBUS monitoring
- Integrated USB transceiver
- Transaction handshaking performed by hardware
- Endpoint buffering anywhere in system RAM
- Integrated DMA to access system RAM and Flash

Note:	The implementation and use of the USB specifications, as well as other third party specifications or technologies, may require licensing; including, but not limited to, USB Implementers Forum, Inc. (also referred to as USB-IF). The user is fully responsible for investigating and satisfying any applicable licensing obligations.

Legend:		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared x = Bit is unknown

bit 31-8 **Unimplemented:** Read as '0'

bit 7-0 **FRML<7:0>:** 11-bit Frame Number Lower bits
The register bits are updated with the current frame number whenever a SOF TOKEN is received.

19.0 INTER-INTEGRATED CIRCUIT (I^{2}C)

Note:	This data sheet summarizes the features of the PIC32MX5XX/6XX/7XX family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 24. "Inter-Integrated Circuit (I^{2}C)"** (DS60001116) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The I^{2}C module provides complete hardware support for both Slave and Multi-Master modes of the I^{2}C serial communication standard. Figure 19-1 illustrates the I^{2}C module block diagram.

Each I^{2}C module has a 2-pin interface: the SCLx pin is clock and the SDAx pin is data.

Each I^{2}C module offers the following key features:

- I^{2}C interface supporting both master and slave operation
- I^{2}C Slave mode supports 7-bit and 10-bit addressing
- I^{2}C Master mode supports 7-bit and 10-bit addressing
- I^{2}C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for the I^{2}C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I^{2}C supports multi-master operation; detects bus collision and arbitrates accordingly
- Provides support for address bit masking

REGISTER 21-1: PMCON: PARALLEL PORT CONTROL REGISTER (CONTINUED)

bit 3 **CS1P:** Chip Select 0 Polarity bit[2]

   `1` = Active-high (PMCS1)
   `0` = Active-low ($\overline{\text{PMCS1}}$)

bit 2 **Unimplemented:** Read as '`0`'

bit 1 **WRSP:** Write Strobe Polarity bit

   For Slave Modes and Master mode 2 (PMMODE<9:8> = `00,01,10`):

   `1` = Write strobe active-high (PMWR)
   `0` = Write strobe active-low ($\overline{\text{PMWR}}$)

   For Master mode 1 (PMMODE<9:8> = `11`):

   `1` = Enable strobe active-high (PMENB)
   `0` = Enable strobe active-low ($\overline{\text{PMENB}}$)

bit 0 **RDSP:** Read Strobe Polarity bit

   For Slave modes and Master mode 2 (PMMODE<9:8> = `00,01,10`):

   `1` = Read Strobe active-high (PMRD)
   `0` = Read Strobe active-low ($\overline{\text{PMRD}}$)

   For Master mode 1 (PMMODE<9:8> = `11`):

   `1` = Read/write strobe active-high (PMRD/$\overline{\text{PMWR}}$)
   `0` = Read/write strobe active-low ($\overline{\text{PMRD}}$/PMWR)

   Note 1: When using the 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON control bit.

   2: These bits have no effect when their corresponding pins are used as address lines.

bit 31-16   **Unimplemented:** Read as '0'

bit 15-0   **FRMRXOKCNT<15:0>:** Frames Received OK Count bits

Increment count for frames received successfully by the RX Filter. This count will not be incremented if there is a Frame Check Sequence (FCS) or Alignment error.

Note 1:	This register is only used for RX operations.
2:	This register is automatically cleared by hardware after a read operation, unless the byte enables for bytes 0/1 are '0'.
3:	It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

REGISTER 25-27: **EMAC1CLRT: ETHERNET CONTROLLER MAC COLLISION WINDOW/RETRY LIMIT REGISTER**

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared x = Bit is unknown

bit 31-14 **Unimplemented:** Read as '0'

bit 13-8 **CWINDOW<5:0>:** Collision Window bits

This is a programmable field representing the slot time or collision window during which collisions occur in properly configured networks. Since the collision window starts at the beginning of transmission, the preamble and SFD is included. Its default of 0x37 (55d) corresponds to the count of frame bytes at the end of the window.

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **RETX<3:0>:** Retransmission Maximum bits

This is a programmable field specifying the number of retransmission attempts following a collision before aborting the packet due to excessive collisions. The Standard specifies the maximum number of attempts (attemptLimit) to be 0xF (15d). Its default is '0xF'.

Note:	Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

REGISTER 25-36: EMAC1MIND: ETHERNET CONTROLLER MAC MII MANAGEMENT INDICATORS REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared x = Bit is unknown

bit 31-4 **Unimplemented:** Read as '0'

bit 3 **LINKFAIL:** Link Fail bit

When '1' is returned - indicates link fail has occurred. This bit reflects the value last read from the PHY status register.

bit 2 **NOTVALID:** MII Management Read Data Not Valid bit

When '1' is returned - indicates an MII management read cycle has not completed and the Read Data is not yet valid.

bit 1 **SCAN:** MII Management Scanning bit

When '1' is returned - indicates a scan operation (continuous MII Management Read cycles) is in progress.

bit 0 **MIIMBUSY:** MII Management Busy bit

When '1' is returned - indicates MII Management module is currently performing an MII Management Read or Write cycle.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

PIC32MX5XX/6XX/7XX

TABLE B-4: SECTION UPDATES (CONTINUED)

Section Name	Update Description
7.0 "Interrupt Controller"	• Updated the following Interrupt Sources in Table 7-1: - Changed IC2AM – I2C4 Master Event to: IC4M – I2C4 Master Event - Changed IC3AM – I2C5 Master Event to: IC5M – I2C4 Master Event - Changed U1E – UART1A Error to: U1E – UART1 Error - Changed U4E – UART1B Error to: U4E – UART4 Error - Changed U1RX – UART1A Receiver to: U1RX – UART1 Receiver - Changed U4RX – UART1B Receiver to: U4RX – UART4 Receiver - Changed U1TX – UART1A Transmitter to: U1TX – UART1 Transmitter - Changed U4TX – UART1B Transmitter to: U4TX – UART4 Transmitter - Changed U6E – UART2B Error to: U6E – UART6 Error - Changed U6RX – UART2B Receiver to: U6RX – UART6 Receiver - Changed U6TX – UART2B Transmitter to: U6TX – UART6 Transmitter - Changed U5E – UART3B Error to: U5E – UART5 Error - Changed U5RX – UART3B Receiver to: U5RX – UART5 Receiver - Changed U5TX – UART3B Transmitter to: U5TX – UART5 Transmitter
1.0 "Oscillator Configuration"	Updated Figure 1-1
1.0 "Output Compare"	Updated Figure 1-1
1.0 "Ethernet Controller"	Added a note on using the Ethernet controller pins (see note above Table 1-3)
1.0 "Comparator Voltage Reference (CVREF)"	Updated the note in Figure 1-1
1.0 "Special Features"	Updated the bit description for bit 10 in Register 1-2 Added notes 1 and 2 to Register 1-4
1.0 "Electrical Characteristics"	Updated the Absolute Maximum Ratings: • Voltage on any 5V tolerant pin with respect to VSS when VDD < 2.3V - 0.3V to +3.6V was updated • Voltage on VBUS with respect to VSS - 0.3V to +5.5V was added Updated the maximum value of DC16 as 2.1 in Table 1-4 Updated the Typical values for the following parameters: DC20b, DC20c, DC21c, DC22c and DC23c (see Table 1-5) Updated Table 1-11: • Removed the following DC Characteristics: Programming temperature 0°C ≤ TA ≤ +70°C (25°C recommended) • Updated the Minimum value for the Parameter number D131 as 2.3 • Removed the Conditions for the following Parameter numbers: D130, D131, D132, D135, D136 and D137 • Updated the condition for the parameter number D130a and D132a Updated the Minimum, Typical and Maximum values for parameter D305 in Table 1-13 Added note 2 to Table 1-18 Updated the Minimum and Maximum values for parameter F20b (see Table 1-19) Updated the following figures: • Figure 1-4 • Figure 1-9 • Figure 1-22 • Figure 1-23
Appendix A: "Migrating from PIC32MX3XX/4XX to PIC32MX5XX/6XX/7XX Devices"	Removed the A.3 Pin Assignments sub-section.
