Welcome to E-XFL.COM

Understanding Embedded - DSP (Digital Signal Processors)

Embedded - DSP (Digital Signal Processors) are specialized microprocessors designed to perform complex mathematical computations on digital signals in real-time. Unlike general-purpose processors, DSPs are optimized for high-speed numeric processing tasks, making them ideal for applications that require efficient and precise manipulation of digital data. These processors are fundamental in converting and processing signals in various forms, including audio, video, and communication signals, ensuring that data is accurately interpreted and utilized in embedded systems.

Applications of Embedded - DSP (Digital Signal Processors)

Details	
Product Status	Active
Type	Fixed Point
Interface	Host Interface, Serial Port
Clock Rate	80MHz
Non-Volatile Memory	External
On-Chip RAM	160kB
Voltage - I/O	1.8V, 2.5V, 3.3V
Voltage - Core	1.80V
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LQFP
Supplier Device Package	100-LQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/adsp-2187nkstz-320

GENERAL DESCRIPTION

The ADSP-218xN series consists of six single chip microcomputers optimized for digital signal processing applications. The high-level block diagram for the ADSP-218xN series members appears on the previous page. All series members are pin-compatible and are differentiated solely by the amount of on-chip SRAM. This feature, combined with ADSP-21xx code compatibility, provides a great deal of flexibility in the design decision. Specific family members are shown in Table 1.

Table 1. ADSP-218xN DSP Microcomputer Family

Device	Program Memory (K words)	Data Memory (K words)
ADSP-2184N	4	4
ADSP-2185N	16	16
ADSP-2186N	8	8
ADSP-2187N	32	32
ADSP-2188N	48	56
ADSP-2189N	32	48

ADSP-218xN series members combine the ADSP-2100 family base architecture (three computational units, data address generators, and a program sequencer) with two serial ports, a 16-bit internal DMA port, a byte DMA port, a programmable timer, Flag I/O, extensive interrupt capabilities, and on-chip program and data memory.

ADSP-218xN series members integrate up to 256K bytes of on-chip memory configured as up to 48K words (24-bit) of program RAM, and up to 56K words (16-bit) of data RAM. Power-down circuitry is also provided to meet the low power needs of battery-operated portable equipment. The ADSP-218xN is available in a 100-lead LQFP package and 144-ball BGA.

Fabricated in a high-speed, low-power, 0.18 µm CMOS process, ADSP-218xN series members operate with a 12.5 ns instruction cycle time. Every instruction can execute in a single processor cycle.

The ADSP-218xN's flexible architecture and comprehensive instruction set allow the processor to perform multiple operations in parallel. In one processor cycle, ADSP-218xN series members can:

- Generate the next program address
- Fetch the next instruction
- Perform one or two data moves
- Update one or two data address pointers
- Perform a computational operation

This takes place while the processor continues to:

- Receive and transmit data through the two serial ports
- Receive and/or transmit data through the internal DMA port
- Receive and/or transmit data through the byte DMA port
- Decrement timer

ARCHITECTURE OVERVIEW

The ADSP-218xN series instruction set provides flexible data moves and multifunction (one or two data moves with a computation) instructions. Every instruction can be executed in a single processor cycle. The ADSP-218xN assembly language uses an algebraic syntax for ease of coding and readability. A comprehensive set of development tools supports program development.

The functional block diagram is an overall block diagram of the ADSP-218xN series. The processor contains three independent computational units: the ALU, the multiplier/accumulator (MAC), and the shifter. The computational units process 16-bit data directly and have provisions to support multiprecision computations. The ALU performs a standard set of arithmetic and logic operations; division primitives are also supported. The MAC performs single-cycle multiply, multiply/add, and multiply/subtract operations with 40 bits of accumulation. The shifter performs logical and arithmetic shifts, normalization, denormalization, and derive exponent operations.

The shifter can be used to efficiently implement numeric format control, including multiword and block floating-point representations.

The internal result (R) bus connects the computational units so that the output of any unit may be the input of any unit on the next cycle.

A powerful program sequencer and two dedicated data address generators ensure efficient delivery of operands to these computational units. The sequencer supports conditional jumps, subroutine calls, and returns in a single cycle. With internal loop counters and loop stacks, ADSP-218xN series members execute looped code with zero overhead; no explicit jump instructions are required to maintain loops.

Two data address generators (DAGs) provide addresses for simultaneous dual operand fetches (from data memory and program memory). Each DAG maintains and updates four address pointers. Whenever the pointer is used to access data (indirect addressing), it is post-modified by the value of one of four possible modify registers. A length value may be associated with each pointer to implement automatic modulo addressing for circular buffers.

Five internal buses provide efficient data transfer:

- Program Memory Address (PMA) Bus
- Program Memory Data (PMD) Bus
- Data Memory Address (DMA) Bus
- Data Memory Data (DMD) Bus
- Result (R) Bus

MODES OF OPERATION

The ADSP-218xN series modes of operation appear in Table 2.

Table 2. Modes of Operation

Mode D	Mode C	Mode B	Mode A	Booting Method
X	0	0	0	BDMA feature is used to load the first 32 program memory words from the byte memory space. Program execution is held off until all 32 words have been loaded. Chip is configured in Full Memory Mode.[1]
X	0	1	0	No automatic boot operations occur. Program execution starts at external memory location 0. Chip is configured in Full Memory Mode. BDMA can still be used, but the processor does not automatically use or wait for these operations.
0	1	0	0	BDMA feature is used to load the first 32 program memory words from the byte memory space. Program execution is held off until all 32 words have been loaded. Chip is configured in Host Mode. $\overline{\text{IACK}}$ has active pull-down. (Requires additonal hardware.)
0	1	0	1	IDMA feature is used to load any internal memory as desired. Program execution is held off until the host writes to internal program memory location 0. Chip is configured in Host Mode. $\overline{\text{IACK}}$ has active pull-down.[1]
1	1	0	0	BDMA feature is used to load the first 32 program memory words from the byte memory space. Program execution is held off until all 32 words have been loaded. Chip is configured in Host Mode; $\overline{\text{IACK}}$ requires external pull-down. (Requires additonal hardware.)
1	1	0	1	IDMA feature is used to load any internal memory as desired. Program execution is held off until the host writes to internal program memory location 0. Chip is configured in Host Mode. $\overline{\text{IACK}}$ requires external pull-down.[1]

[1] Considered as standard operating settings. Using these configurations allows for easier design and better memory management.

Setting Memory Mode

Memory Mode selection for the ADSP-218xN series is made during chip reset through the use of the Mode C pin. This pin is multiplexed with the DSP's PF2 pin, so care must be taken in how the mode selection is made. The two methods for selecting the value of Mode C are active and passive.

Passive Configuration

Passive Configuration involves the use of a pull-up or pull-down resistor connected to the Mode C pin. To minimize power consumption, or if the PF2 pin is to be used as an output in the DSP application, a weak pull-up or pull-down resistance, on the order of 10 kΩ, can be used. This value should be sufficient to pull the pin to the desired level and still allow the pin to operate as a programmable flag output without undue strain on the processor's output driver. For minimum power consumption during power-down, reconfigure PF2 to be an input, as the pull-up or pull-down resistance will hold the pin in a known state, and will not switch.

Active Configuration

Active Configuration involves the use of a three-statable external driver connected to the Mode C pin. A driver's output enable should be connected to the DSP's $\overline{\text{RESET}}$ signal such that it only drives the PF2 pin when $\overline{\text{RESET}}$ is active (low). When $\overline{\text{RESET}}$ is deasserted, the driver should be three-state, thus allowing full use of the PF2 pin as either an input or output. To minimize power consumption during power-down, configure the programmable flag as an output when connected to a three-stated buffer. This ensures that the pin will be held at a constant level, and will not oscillate should the three-state driver's level hover around the logic switching point.

IDMA ACK Configuration

Mode D = 0 and in host mode: $\overline{\text{IACK}}$ is an active, driven signal and cannot be "wire-OR'ed." Mode D = 1 and in host mode: $\overline{\text{IACK}}$ is an open drain and requires an external pull-down, but multiple $\overline{\text{IACK}}$ pins can be "wire-OR'ed" together.

INTERRUPTS

The interrupt controller allows the processor to respond to the eleven possible interrupts and reset with minimum overhead. ADSP-218xN series members provide four dedicated external interrupt input pins: $\overline{\text{IRQ2}}$, $\overline{\text{IRQL0}}$, $\overline{\text{IRQL1}}$, and $\overline{\text{IRQE}}$ (shared with the PF7–4 pins). In addition, SPORT1 may be reconfigured for $\overline{\text{IRQ0}}$, $\overline{\text{IRQ1}}$, FI, and FO, for a total of six external interrupts. The ADSP-218xN also supports internal interrupts from the timer, the byte DMA port, the two serial ports, software, and the power-down control circuit. The interrupt levels are internally prioritized and individually maskable (except power-down and reset). The $\overline{\text{IRQ2}}$, $\overline{\text{IRQ0}}$, and $\overline{\text{IRQ1}}$ input pins can be programmed to be either level- or edge-sensitive. $\overline{\text{IRQL0}}$ and $\overline{\text{IRQL1}}$ are level-sensitive and $\overline{\text{IRQE}}$ is edge-sensitive. The priorities and vector addresses of all interrupts are shown in Table 3.

Table 3. Interrupt Priority and Interrupt Vector Addresses

Source Of Interrupt	Interrupt Vector Address (Hex)
Reset (or Power-Up with PUCR = 1)	0x0000 (Highest Priority)
Power-Down (Nonmaskable)	0x002C
$\overline{\text{IRQ2}}$	0x0004
$\overline{\text{IRQL1}}$	0x0008
$\overline{\text{IRQL0}}$	0x000C
SPORT0 Transmit	0x0010
SPORT0 Receive	0x0014
$\overline{\text{IRQE}}$	0x0018
BDMA Interrupt	0x001C
SPORT1 Transmit or $\overline{\text{IRQ1}}$	0x0020
SPORT1 Receive or $\overline{\text{IRQ0}}$	0x0024
Timer	0x0028 (Lowest Priority)

Interrupt routines can either be nested with higher priority interrupts taking precedence or processed sequentially. Interrupts can be masked or unmasked with the IMASK register. Individual interrupt requests are logically ANDed with the bits in IMASK; the highest priority unmasked interrupt is then selected. The power-down interrupt is nonmaskable.

ADSP-218xN series members mask all interrupts for one instruction cycle following the execution of an instruction that modifies the IMASK register. This does not affect serial port autobuffering or DMA transfers.

The interrupt control register, ICNTL, controls interrupt nesting and defines the $\overline{\text{IRQ0}}$, $\overline{\text{IRQ1}}$, and $\overline{\text{IRQ2}}$ external interrupts to be either edge- or level-sensitive. The $\overline{\text{IRQE}}$ pin is an external edge-sensitive interrupt and can be forced and cleared. The $\overline{\text{IRQL0}}$ and $\overline{\text{IRQL1}}$ pins are external level sensitive interrupts.

The IFC register is a write-only register used to force and clear interrupts. On-chip stacks preserve the processor status and are automatically maintained during interrupt handling. The stacks are 12 levels deep to allow interrupt, loop, and subroutine nesting. The following instructions allow global enable or disable servicing of the interrupts (including power-down), regardless of the state of IMASK:

```
ENA INTS;
DIS INTS;
```

Disabling the interrupts does not affect serial port autobuffering or DMA. When the processor is reset, interrupt servicing is enabled.

LOW-POWER OPERATION

ADSP-218xN series members have three low-power modes that significantly reduce the power dissipation when the device operates under standby conditions. These modes are:

- Power-Down
- Idle
- Slow Idle

The CLKOUT pin may also be disabled to reduce external power dissipation.

Power-Down

ADSP-218xN series members have a low-power feature that lets the processor enter a very low-power dormant state through hardware or software control. Following is a brief list of power-down features. Refer to the *ADSP-218x DSP Hardware Reference*, "System Interface" chapter, for detailed information about the power-down feature.

- Quick recovery from power-down. The processor begins executing instructions in as few as 200 CLKIN cycles.
- Support for an externally generated TTL or CMOS processor clock. The external clock can continue running during power-down without affecting the lowest power rating and 200 CLKIN cycle recovery.
- Support for crystal operation includes disabling the oscillator to save power (the processor automatically waits approximately 4096 CLKIN cycles for the crystal oscillator to start or stabilize), and letting the oscillator run to allow 200 CLKIN cycle start-up.
- Power-down is initiated by either the power-down pin ($\overline{\text{PWD}}$) or the software power-down force bit. Interrupt support allows an unlimited number of instructions to be executed before optionally powering down. The power-down interrupt also can be used as a nonmaskable, edge-sensitive interrupt.
- Context clear/save control allows the processor to continue where it left off or start with a clean context when leaving the power-down state.
- The $\overline{\text{RESET}}$ pin also can be used to terminate power-down.
- Power-down acknowledge pin (PWDACK) indicates when the processor has entered power-down.

Idle

When the ADSP-218xN is in the Idle Mode, the processor waits indefinitely in a low-power state until an interrupt occurs. When an unmasked interrupt occurs, it is serviced; execution then continues with the instruction following the IDLE instruction. In Idle mode IDMA, BDMA, and autobuffer cycle steals still occur.

Slow Idle

The IDLE instruction is enhanced on ADSP-218xN series members to let the processor's internal clock signal be slowed, further reducing power consumption. The reduced clock frequency, a programmable fraction of the normal clock rate, is specified by a selectable divisor given in the IDLE instruction.

The format of the instruction is:

```
IDLE (n);
```

where n = 16, 32, 64, or 128. This instruction keeps the processor fully functional, but operating at the slower clock rate. While it is in this state, the processor's other internal clock signals,

such as SCLK, CLKOUT, and timer clock, are reduced by the same ratio. The default form of the instruction, when no clock divisor is given, is the standard IDLE instruction.

When the IDLE (n) instruction is used, it effectively slows down the processor's internal clock and thus its response time to incoming interrupts. The one-cycle response time of the standard idle state is increased by n, the clock divisor. When an enabled interrupt is received, ADSP-218xN series members remain in the idle state for up to a maximum of n processor cycles (n = 16, 32, 64, or 128) before resuming normal operation.

When the IDLE (n) instruction is used in systems that have an externally generated serial clock (SCLK), the serial clock rate may be faster than the processor's reduced internal clock rate. Under these conditions, interrupts must not be generated at a faster rate than can be serviced, due to the additional time the processor takes to come out of the idle state (a maximum of n processor cycles).

SYSTEM INTERFACE

Figure 2 shows typical basic system configurations with the ADSP-218xN series, two serial devices, a byte-wide EPROM, and optional external program and data overlay memories (mode-selectable). Programmable wait state generation allows the processor to connect easily to slow peripheral devices. ADSP-218xN series members also provide four external interrupts and two serial ports or six external interrupts and one serial port. Host Memory Mode allows access to the full external data bus, but limits addressing to a single address bit (A0). Through the use of external hardware, additional system peripherals can be added in this mode to generate and latch address signals.

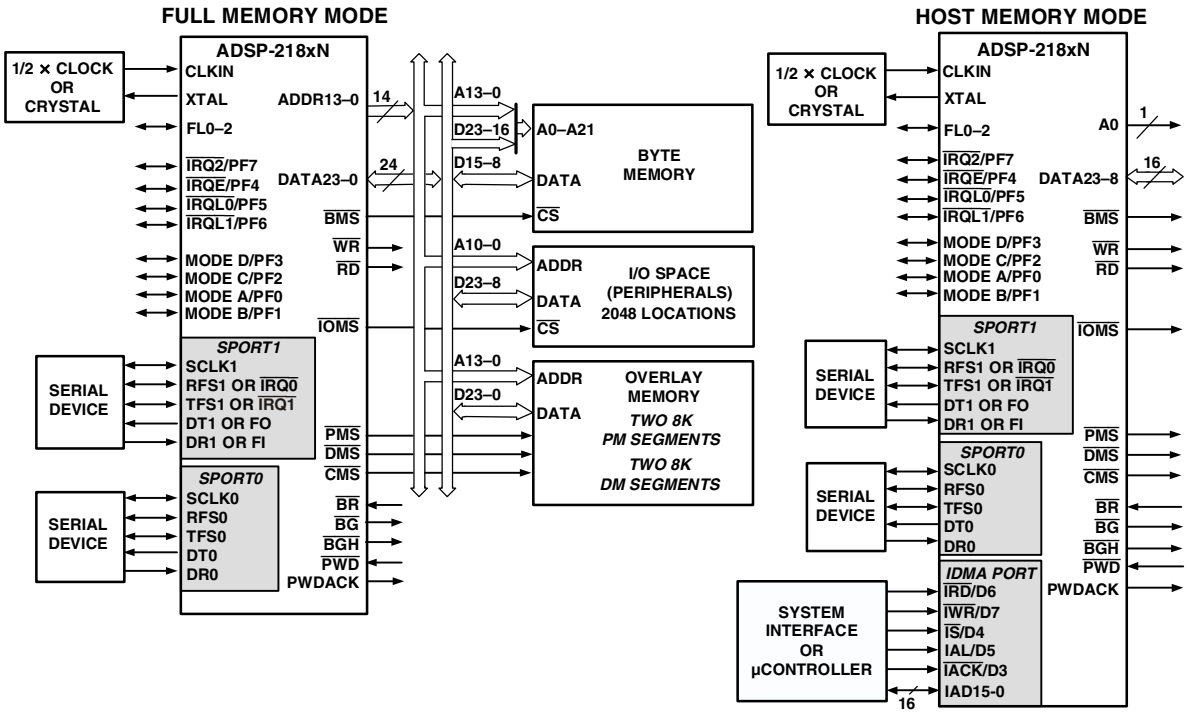

Figure 2. Basic System Interface

MEMORY ARCHITECTURE

The ADSP-218xN series provides a variety of memory and peripheral interface options. The key functional groups are Program Memory, Data Memory, Byte Memory, and I/O. Refer to Figure 4 through Figure 9, Table 4 on Page 11, and Table 5 on Page 11 for PM and DM memory allocations in the ADSP-218xN series.

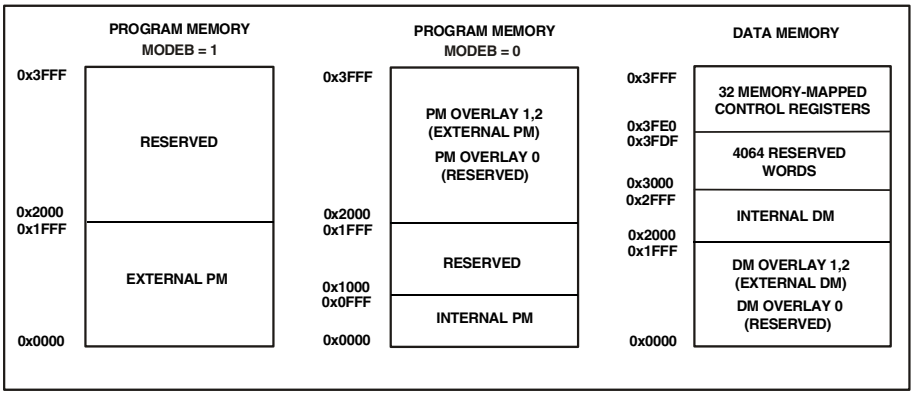

Figure 4. ADSP-2184 Memory Architecture

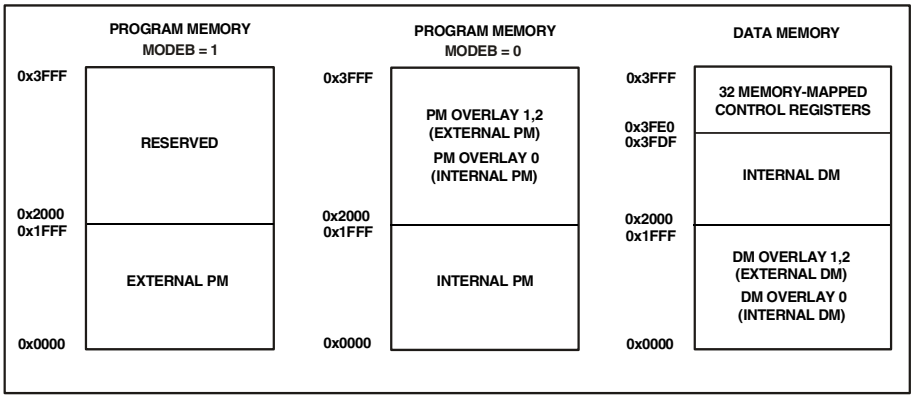

Figure 5. ADSP-2185 Memory Architecture

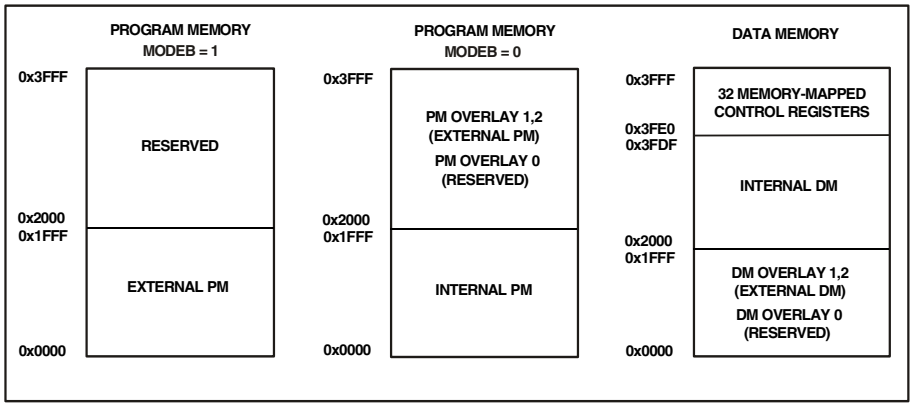

Figure 6. ADSP-2186 Memory Architecture

IOWAIT0–3 as shown in Figure 10, which in combination with the wait state mode bit, specify up to 15 wait states to be automatically generated for each of four regions. The wait states act on address ranges, as shown in Table 6.

Note: In Full Memory Mode, all 2048 locations of I/O space are directly addressable. In Host Memory Mode, only address pin A0 is available; therefore, additional logic is required externally to achieve complete addressability of the 2048 I/O space locations.

Table 6. Wait States

Address Range	Wait State Register
0x000–0x1FF	IOWAIT0 and Wait State Mode Select Bit
0x200–0x3FF	IOWAIT1 and Wait State Mode Select Bit
0x400–0x5FF	IOWAIT2 and Wait State Mode Select Bit
0x600–0x7FF	IOWAIT3 and Wait State Mode Select Bit

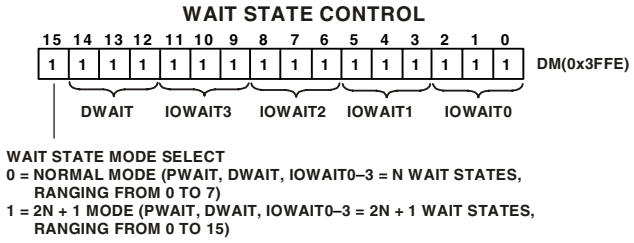

Figure 10. Wait State Control Register

Composite Memory Select

ADSP-218xN series members have a programmable memory select signal that is useful for generating memory select signals for memories mapped to more than one space. The $\overline{\text{CMS}}$ signal is generated to have the same timing as each of the individual memory select signals ($\overline{\text{PMS}}$, $\overline{\text{DMS}}$, $\overline{\text{BMS}}$, $\overline{\text{IOMS}}$) but can combine their functionality. Each bit in the CMSSEL register, when set, causes the $\overline{\text{CMS}}$ signal to be asserted when the selected memory select is asserted. For example, to use a 32K word memory to act as both program and data memory, set the $\overline{\text{PMS}}$ and $\overline{\text{DMS}}$ bits in the CMSSEL register and use the $\overline{\text{CMS}}$ pin to drive the chip select of the memory, and use either $\overline{\text{DMS}}$ or $\overline{\text{PMS}}$ as the additional address bit.

The $\overline{\text{CMS}}$ pin functions like the other memory select signals with the same timing and bus request logic. A 1 in the enable bit causes the assertion of the $\overline{\text{CMS}}$ signal at the same time as the selected memory select signal. All enable bits default to 1 at reset, except the $\overline{\text{BMS}}$ bit.

See Figure 11 and Figure 12 for illustration of the programmable flag and composite control register and the system control register.

Byte Memory Select

The ADSP-218xN's $\overline{\text{BMS}}$ disable feature combined with the $\overline{\text{CMS}}$ pin allows use of multiple memories in the byte memory space. For example, an EPROM could be attached to the $\overline{\text{BMS}}$

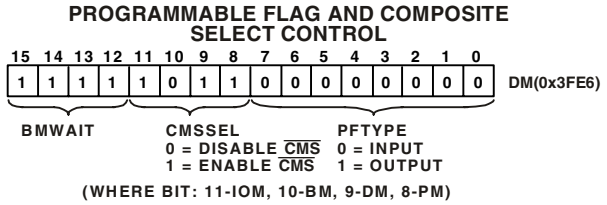

Figure 11. Programmable Flag and Composite Control Register

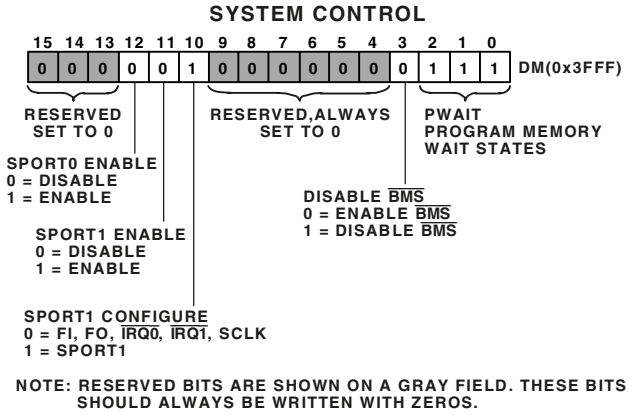

Figure 12. System Control Register

select, and a flash memory could be connected to $\overline{\text{CMS}}$. Because at reset $\overline{\text{BMS}}$ is enabled, the EPROM would be used for booting. After booting, software could disable $\overline{\text{BMS}}$ and set the $\overline{\text{CMS}}$ signal to respond to $\overline{\text{BMS}}$, enabling the flash memory.

Byte Memory

The byte memory space is a bidirectional, 8-bit-wide, external memory space used to store programs and data. Byte memory is accessed using the BDMA feature. The byte memory space consists of 256 pages, each of which is 16K × 8 bits.

The byte memory space on the ADSP-218xN series supports read and write operations as well as four different data formats. The byte memory uses data bits 15–8 for data. The byte memory uses data bits 23–16 and address bits 13–0 to create a 22-bit address. This allows up to a 4 megabit × 8 (32 megabit) ROM or RAM to be used without glue logic. All byte memory accesses are timed by the BMWAIT register and the wait state mode bit.

Byte Memory DMA (BDMA, Full Memory Mode)

The byte memory DMA controller (Figure 13) allows loading and storing of program instructions and data using the byte memory space. The BDMA circuit is able to access the byte memory space while the processor is operating normally and steals only one DSP cycle per 8-, 16-, or 24-bit word transferred.

The IDMA port has a 16-bit multiplexed address and data bus and supports 24-bit program memory. The IDMA port is completely asynchronous and can be written while the ADSP-218xN is operating at full speed.

The DSP memory address is latched and then automatically incremented after each IDMA transaction. An external device can therefore access a block of sequentially addressed memory by specifying only the starting address of the block. This increases throughput as the address does not have to be sent for each memory access.

IDMA port access occurs in two phases. The first is the IDMA Address Latch cycle. When the acknowledge is asserted, a 14-bit address and 1-bit destination type can be driven onto the bus by an external device. The address specifies an on-chip memory location, the destination type specifies whether it is a DM or PM access. The falling edge of the IDMA address latch signal (IAL) or the missing edge of the IDMA select signal ($\overline{IS}$) latches this value into the IDMAA register.

Once the address is stored, data can be read from, or written to, the ADSP-218xN's on-chip memory. Asserting the select line ($\overline{IS}$) and the appropriate read or write line ($\overline{IRD}$ and $\overline{IWR}$ respectively) signals the ADSP-218xN that a particular transaction is required. In either case, there is a one-processor-cycle delay for synchronization. The memory access consumes one additional processor cycle.

Once an access has occurred, the latched address is automatically incremented, and another access can occur.

Through the IDMAA register, the DSP can also specify the starting address and data format for DMA operation. Asserting the IDMA port select ($\overline{IS}$) and address latch enable (IAL) directs the ADSP-218xN to write the address onto the IAD14–0 bus into the IDMA Control Register (Figure 14). If Bit 15 is set to 0, IDMA latches the address. If Bit 15 is set to 1, IDMA latches into the OVLAY register. This register, also shown in Figure 14, is memory-mapped at address DM (0x3FE0). Note that the latched address (IDMAA) cannot be read back by the host.

When Bit 14 in 0x3FE7 is set to zero, short reads use the timing shown in Figure 36 on Page 38. When Bit 14 in 0x3FE7 is set to 1, timing in Figure 37 on Page 39 applies for short reads in short read only mode. Set IDDMOVLAY and IDPMOVLAY bits in the IDMA overlay register as indicated in Table 8. Refer to the *ADSP-218x DSP Hardware Reference* for additional details.

Note: In full memory mode all locations of 4M-byte memory space are directly addressable. In host memory mode, only address pin A0 is available, requiring additional external logic to provide address information for the byte.

Bootstrap Loading (Booting)

ADSP-218xN series members have two mechanisms to allow automatic loading of the internal program memory after reset. The method for booting is controlled by the Mode A, B, and C configuration bits.

When the mode pins specify BDMA booting, the ADSP-218xN initiates a BDMA boot sequence when reset is released.

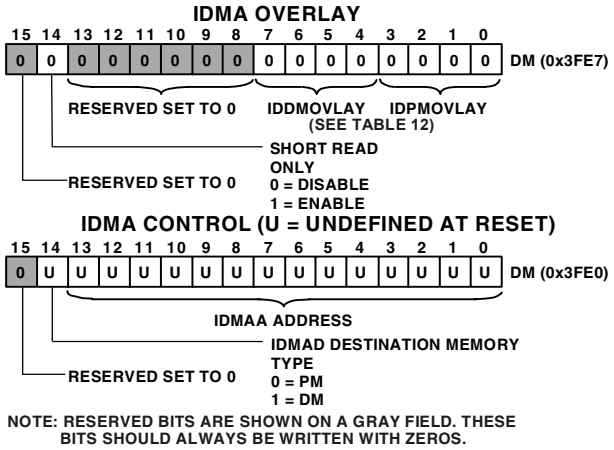

Figure 14. IDMA OVLAY/Control Registers

The BDMA interface is set up during reset to the following defaults when BDMA booting is specified: the BDIR, BMPAGE, BIAD, and BEAD registers are set to 0, the BTYPE register is set to 0 to specify program memory 24-bit words, and the BWCOUNT register is set to 32. This causes 32 words of on-chip program memory to be loaded from byte memory. These 32 words are used to set up the BDMA to load in the remaining program code. The BCR bit is also set to 1, which causes program execution to be held off until all 32 words are loaded into on-chip program memory. Execution then begins at address 0.

The ADSP-2100 Family development software (Revision 5.02 and later) fully supports the BDMA booting feature and can generate byte memory space-compatible boot code.

The IDLE instruction can also be used to allow the processor to hold off execution while booting continues through the BDMA interface. For BDMA accesses while in Host Mode, the addresses to boot memory must be constructed externally to the ADSP-218xN. The only memory address bit provided by the processor is A0.

IDMA Port Booting

ADSP-218xN series members can also boot programs through its internal DMA port. If Mode C = 1, Mode B = 0, and Mode A = 1, the ADSP-218xN boots from the IDMA port. IDMA feature can load as much on-chip memory as desired. Program execution is held off until the host writes to on-chip program memory location 0.

BUS REQUEST AND BUS GRANT

ADSP-218xN series members can relinquish control of the data and address buses to an external device. When the external device requires access to memory, it asserts the Bus Request

The EZ-ICE uses the EE (emulator enable) signal to take control of the ADSP-218xN in the target system. This causes the processor to use its $\overline{\text{ERESET}}$, $\overline{\text{EBR}}$, and $\overline{\text{EBG}}$ pins instead of the $\overline{\text{RESET}}$, $\overline{\text{BR}}$, and $\overline{\text{BG}}$ pins. The $\overline{\text{BG}}$ output is three-stated. These signals do not need to be jumper-isolated in the system.

The EZ-ICE connects to the target system via a ribbon cable and a 14-pin female plug. The female plug is plugged onto the 14-pin connector (a pin strip header) on the target board.

Target Board Connector for EZ-ICE Probe

The EZ-ICE connector (a standard pin strip header) is shown in Figure 16. This connector must be added to the target board design to use the EZ-ICE. Be sure to allow enough room in the system to fit the EZ-ICE probe onto the 14-pin connector.

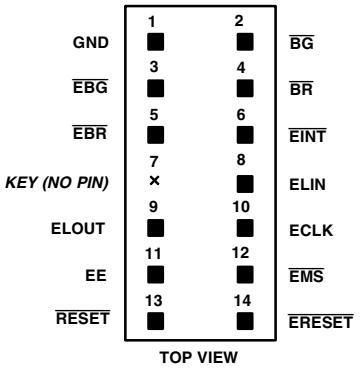

Figure 16. Target Board Connector for EZ-ICE

The 14-pin, 2-row pin strip header is keyed at the Pin 7 location—Pin 7 must be removed from the header. The pins must be 0.025 inch square and at least 0.20 inch in length. Pin spacing should be 0.1 × 0.1 inch. The pin strip header must have at least 0.15 inch clearance on all sides to accept the EZ-ICE probe plug.

Pin strip headers are available from vendors such as 3M, McKenzie, and Samtec.

Target Memory Interface

For the target system to be compatible with the EZ-ICE emulator, it must comply with the following memory interface guidelines:

Design the Program Memory (PM), Data Memory (DM), Byte Memory (BM), I/O Memory (IOM), and Composite Memory (CM) external interfaces to comply with worst-case device timing requirements and switching characteristics as specified in this data sheet. The performance of the EZ-ICE may approach published worst-case specification for some memory access timing requirements and switching characteristics.

Note: If the target does not meet the worst-case chip specification for memory access parameters, the circuitry may not be able to be emulated at the desired CLKIN frequency. Depending on the severity of the specification violation, the system may be difficult to manufacture, as DSP components statistically vary in switching characteristic and timing requirements, within published limits.

Restriction: All memory strobe signals on the ADSP-218xN ($\overline{\text{RD}}$, $\overline{\text{WR}}$, $\overline{\text{PMS}}$, $\overline{\text{DMS}}$, $\overline{\text{BMS}}$, $\overline{\text{CMS}}$, and $\overline{\text{IOMS}}$) used in the target system must have 10 kΩ pull-up resistors connected when the EZ-ICE is being used. The pull-up resistors are necessary because there are no internal pull-ups to guarantee their state during prolonged three-state conditions resulting from typical EZ-ICE debugging sessions. These resistors may be removed when the EZ-ICE is not being used.

Target System Interface Signals

When the EZ-ICE board is installed, the performance on some system signals changes. Design the system to be compatible with the following system interface signal changes introduced by the EZ-ICE board:

- EZ-ICE emulation introduces an 8 ns propagation delay between the target circuitry and the DSP on the $\overline{\text{RESET}}$ signal.
- EZ-ICE emulation introduces an 8 ns propagation delay between the target circuitry and the DSP on the $\overline{\text{BR}}$ signal.
- EZ-ICE emulation ignores $\overline{\text{RESET}}$ and $\overline{\text{BR}}$, when single-stepping.
- EZ-ICE emulation ignores $\overline{\text{RESET}}$ and $\overline{\text{BR}}$ when in Emulator Space (DSP halted).
- EZ-ICE emulation ignores the state of target $\overline{\text{BR}}$ in certain modes. As a result, the target system may take control of the DSP's external memory bus only if bus grant ($\overline{\text{BG}}$) is asserted by the EZ-ICE board's DSP.

ADDITIONAL INFORMATION

This data sheet provides a general overview of ADSP-218xN series functionality. For additional information on the architecture and instruction set of the processor, refer to the *ADSP-218x DSP Hardware Reference and the* ADSP-218x DSP Instruction Set Reference.

PIN DESCRIPTIONS

ADSP-218xN series members are available in a 100-lead LQFP package and a 144-ball BGA package. In order to maintain maximum functionality and reduce package size and pin count, some serial port, programmable flag, interrupt and external bus pins have dual, multiplexed functionality. The external bus pins are configured during $\overline{\text{RESET}}$ only, while serial port pins are software configurable during program execution. Flag and interrupt functionality is retained concurrently on multiplexed pins. In cases where pin functionality is reconfigurable, the default state is shown in plain text in Table 9, while alternate functionality is shown in *italics*.

Table 9. Common-Mode Pins

Pin Name	No. of Pins	I/O	Function
$\overline{\text{RESET}}$	1	I	Processor Reset Input
$\overline{\text{BR}}$	1	I	Bus Request Input
$\overline{\text{BG}}$	1	O	Bus Grant Output
$\overline{\text{BGH}}$	1	O	Bus Grant Hung Output
$\overline{\text{DMS}}$	1	O	Data Memory Select Output
$\overline{\text{PMS}}$	1	O	Program Memory Select Output
$\overline{\text{IOMS}}$	1	O	Memory Select Output
$\overline{\text{BMS}}$	1	O	Byte Memory Select Output
$\overline{\text{CMS}}$	1	O	Combined Memory Select Output
$\overline{\text{RD}}$	1	O	Memory Read Enable Output
$\overline{\text{WR}}$	1	O	Memory Write Enable Output
$\overline{\text{IRQ2}}$	1	I	Edge- or Level-Sensitive Interrupt Request[1]
PF7		I/O	Programmable I/O Pin
$\overline{\text{IRQL1}}$	1	I	Level-Sensitive Interrupt Requests[1]

SPECIFICATIONS

RECOMMENDED OPERATING CONDITIONS

Parameter[1]	K Grade (Commercial)		B Grade (Industrial)		Unit
	Min	Max	Min	Max	
V_{DDINT}	1.71	1.89	1.8	2.0	V
V_{DDEXT}	1.71	3.6	1.8	3.6	V
V_{INPUT}[2]	V_{IL} = – 0.3	V_{IH} = + 3.6	V_{IL} = – 0.3	V_{IH} = + 3.6	V
T_{AMB}	0	70	–40	+85	°C

[1] Specifications subject to change without notice.

[2] The ADSP-218xN is 3.3 V tolerant (always accepts up to 3.6 V max V_{IH}), but voltage compliance (on outputs, V_{OH}) depends on the input V_{DDEXT}, because V_{OH} (max) approximately equals V_{DDEXT} (max). This 3.3 V tolerance applies to bidirectional pins (D23–D0, RFS0, RFS1, SCLK0, SCLK1, TFS0, TFS1, A13–A1, PF7–PF0) and input-only pins (CLKIN, $\overline{\text{RESET}}$, $\overline{\text{BR}}$, DR0, DR1, $\overline{\text{PWD}}$).

ELECTRICAL CHARACTERISTICS

Parameter[1]	Description	Test Conditions	Min	Typ	Max	Unit
V_{IH}	Hi-Level Input Voltage[2, 3]	@ V_{DDEXT} = 1.71 V to 2.0 V, V_{DDINT} = max	1.25			V
		@ V_{DDEXT} = 2.1 V to 3.6 V, V_{DDINT} = max	1.7			V
V_{IL}	Lo-Level Input Voltage[2, 3]	@ $V_{DDEXT} \leq$ 2.0 V, V_{DDINT} = min			0.6	V
		@ $V_{DDEXT} \geq$ 2.0 V, V_{DDINT} = min			0.7	V
V_{OH}	Hi-Level Output Voltage[2, 4, 5]	@ V_{DDEXT} = 1.71 V to 2.0 V, I_{OH} = – 0.5 mA	1.35			V
		@ V_{DDEXT} = 2.1 V to 2.9 V, I_{OH} = – 0.5 mA	2.0			V
		@ V_{DDEXT} = 3.0 V to 3.6 V, I_{OH} = – 0.5 mA	2.4			V
		@ V_{DDEXT} = 1.71 V to 3.6 V, I_{OH} = – 100 µA[6]	V_{DDEXT} – 0.3			V
V_{OL}	Lo-Level Output Voltage[2, 4, 5]	@ V_{DDEXT} = 1.71 V to 3.6 V, I_{OL} = 2.0 mA			0.4	V
I_{IH}	Hi-Level Input Current[3]	@ V_{DDINT} = max, V_{IN} = 3.6 V			10	µA
I_{IL}	Lo-Level Input Current[3]	@ V_{DDINT} = max, V_{IN} = 0 V			10	µA
I_{OZH}	Three-State Leakage Current[7]	@ V_{DDEXT} = max, V_{IN} = 3.6 V[8]			10	µA
I_{OZL}	Three-State Leakage Current[7]	@ V_{DDEXT} = max, V_{IN} = 0 V[8]			10	µA
I_{DD}	Supply Current (Idle)[9]	@ V_{DDINT} = 1.8 V, t_{CK} = 12.5 ns, T_{AMB} = 25°C		6		mA
I_{DD}	Supply Current (Dynamic)[10]	@ V_{DDINT} = 1.8 V, t_{CK} = 12.5 ns[11], T_{AMB} = 25°C		25		mA

Parameter[1]	Description	Test Conditions	Min	Typ	Max	Unit
I_{DD}	Supply Current (Idle)[9]	@ V_{DDINT} = 1.9 V, t_{CK} = 12.5 ns, T_{AMB} = 25°C		6.5		mA
I_{DD}	Supply Current (Dynamic)[10]	@ V_{DDINT} = 1.9 V, t_{CK} = 12.5 ns[11], T_{AMB} = 25°C		26		mA
I_{DD}	Supply Current (Power-Down)[12]	@ V_{DDINT} = 1.8 V, T_{AMB} = 25°C in Lowest Power Mode		100		µA
C_I	Input Pin Capacitance[3, 6]	@ V_{IN} = 1.8 V, f_{IN} = 1.0 MHz, T_{AMB} = 25°C			8	pF
C_O	Output Pin Capacitance[6, 7, 12, 13]	@ V_{IN} = 1.8 V, f_{IN} = 1.0 MHz, T_{AMB} = 25°C			8	pF

[1] Specifications subject to change without notice.
[2] Bidirectional pins: D23–0, RFS0, RFS1, SCLK0, SCLK1, TFS0, TFS1, A13–1, PF7–0.
[3] Input only pins: CLKIN, $\overline{\text{RESET}}$, $\overline{\text{BR}}$, DR0, DR1, $\overline{\text{PWD}}$.
[4] Output pins: $\overline{\text{BG}}$, $\overline{\text{PMS}}$, $\overline{\text{DMS}}$, $\overline{\text{BMS}}$, $\overline{\text{IOMS}}$, $\overline{\text{CMS}}$, $\overline{\text{RD}}$, $\overline{\text{WR}}$, PWDACK, A0, DT0, DT1, CLKOUT, FL2–FL0, $\overline{\text{BGH}}$.
[5] Although specified for TTL outputs, all ADSP-218xN outputs are CMOS-compatible and will drive to V_{DDEXT} and GND, assuming no dc loads.
[6] Guaranteed but not tested.
[7] Three-statable pins: A13–A1, D23–D0, $\overline{\text{PMS}}$, $\overline{\text{DMS}}$, $\overline{\text{BMS}}$, $\overline{\text{IOMS}}$, $\overline{\text{CMS}}$, $\overline{\text{RD}}$, $\overline{\text{WR}}$, DT0, DT1, SCLK0, SCLK1, TFS0, TFS1, RFS0, RFS1, PF7–PF0.
[8] 0 V on $\overline{\text{BR}}$.
[9] Idle refers to ADSP-218xN state of operation during execution of IDLE instruction. Deasserted pins are driven to either V_{DD} or GND.
[10] I_{DD} measurement taken with all instructions executing from internal memory. 50% of the instructions are multifunction (Types 1, 4, 5, 12, 13, 14), 30% are Type 2 and Type 6, and 20% are idle instructions.
[11] V_{IN} = 0 V and 3 V. For typical values for supply currents, refer to *Power Dissipation* section.
[12] See *ADSP-218x DSP Hardware Reference* for details.
[13] Output pin capacitance is the capacitive load for any three-stated output pin.

ABSOLUTE MAXIMUM RATINGS

Parameter	Rating
Internal Supply Voltage (V_{DDINT})[1]	–0.3 V to +2.2 V
External Supply Voltage (V_{DDEXT})	–0.3 V to +4.0 V
Input Voltage[2]	–0.5 V to +4.0 V
Output Voltage Swing[3]	–0.5 V to V_{DDEXT} +0.5 V
Operating Temperature Range	–40°C to +85°C
Storage Temperature Range	–65°C to +150°C

[1] Stresses greater than those listed above may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions greater than those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
[2] Applies to Bidirectional pins (D23–0, RFS0, RFS1, SCLK0, SCLK1, TFS0, TFS1, A13–1, PF7–0) and Input only pins (CLKIN, $\overline{\text{RESET}}$, $\overline{\text{BR}}$, DR0, DR1, $\overline{\text{PWD}}$).
[3] Applies to Output pins ($\overline{\text{BG}}$, $\overline{\text{PMS}}$, $\overline{\text{DMS}}$, $\overline{\text{BMS}}$, $\overline{\text{IOMS}}$, $\overline{\text{CMS}}$, $\overline{\text{RD}}$, $\overline{\text{WR}}$, PWDACK, A0, DT0, DT1, CLKOUT, FL2–0, $\overline{\text{BGH}}$).

ESD SENSITIVITY

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADSP-218xN features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

ENVIRONMENTAL CONDITIONS

Table 14. Thermal Resistance

Rating Description[1]	Symbol	LQFP (°C/W)	BGA (°C/W)
Thermal Resistance (Case-to-Ambient)	θ_{CA}	48	63.3
Thermal Resistance (Junction-to-Ambient)	θ_{JA}	50	70.7
Thermal Resistance (Junction-to-Case)	θ_{JC}	2	7.4

[1] Where the Ambient Temperature Rating (T_{AMB}) is:
$T_{AMB} = T_{CASE} - (PD \times \theta_{CA})$
T_{CASE} = Case Temperature in °C
PD = Power Dissipation in W

TEST CONDITIONS

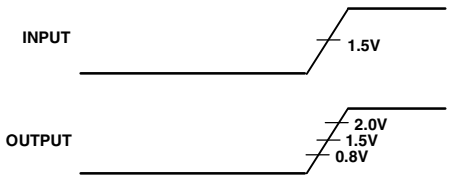

Figure 18. Voltage Reference Levels for AC Measurements (Except Output Enable/Disable)

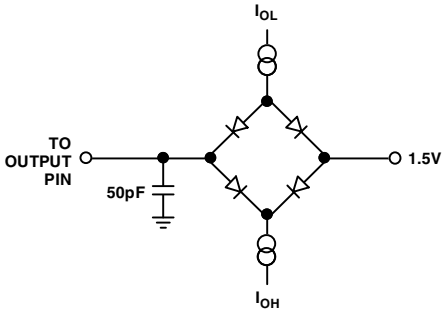

Figure 19. Equivalent Loading for AC Measurements (Including All Fixtures)

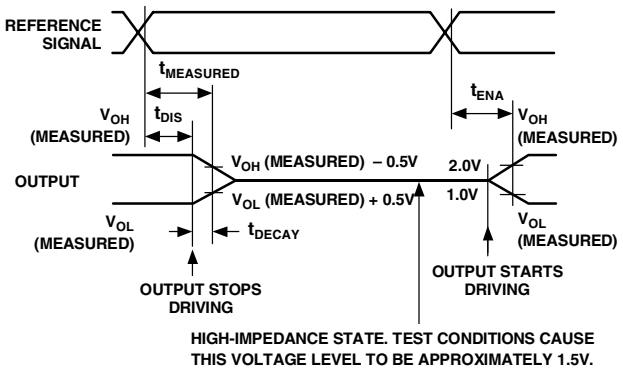

Figure 20. Output Enable/Disable

Output Disable Time

Output pins are considered to be disabled when they have stopped driving and started a transition from the measured output high or low voltage to a high impedance state. The output disable time (t_{DIS}) is the difference of $t_{MEASURED}$ and t_{DECAY}, as shown in Figure 20. The time is the interval from when a reference signal reaches a high or low voltage level to when the output voltages have changed by 0.5 V from the measured output high or low voltage.

The decay time, t_{DECAY}, is dependent on the capacitive load, C_L, and the current load, i_L, on the output pin. It can be approximated by the following equation:

$$t_{DECAY} = \frac{C_L \times 0.5V}{i_L}$$

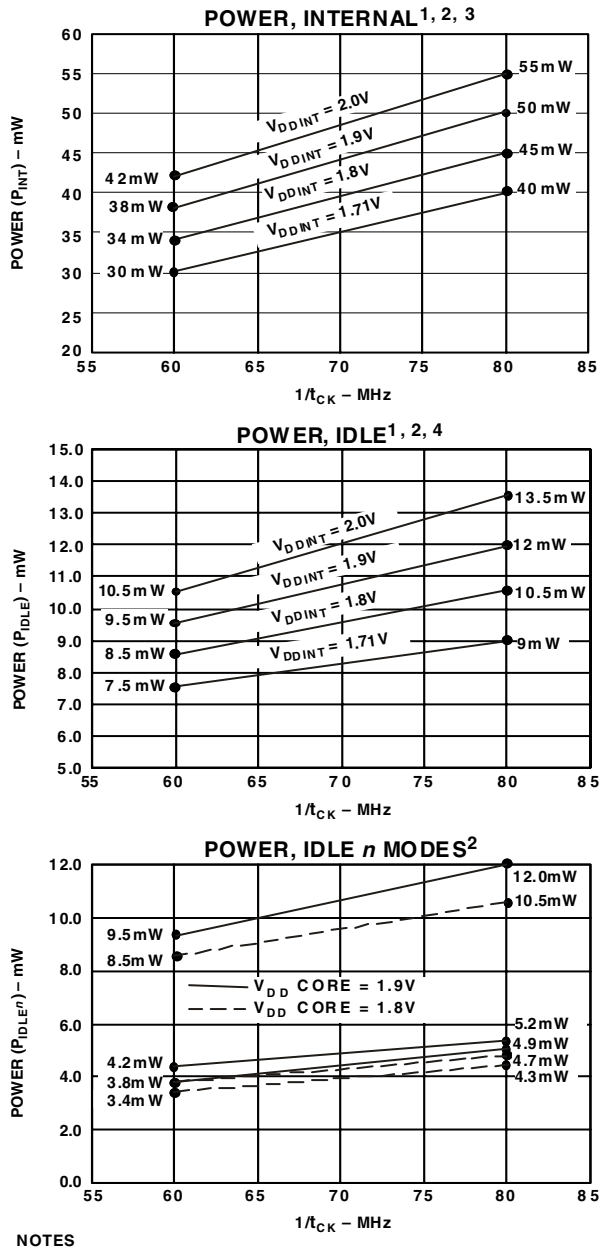
from which

$$t_{DIS} = t_{MEASURED} - t_{DECAY}$$

is calculated. If multiple pins (such as the data bus) are disabled, the measurement value is that of the last pin to stop driving.

Output Enable Time

Output pins are considered to be enabled when they have made a transition from a high-impedance state to when they start driving. The output enable time (t_{ENA}) is the interval from when a reference signal reaches a high or low voltage level to when the output has reached a specified high or low trip point, as shown in Figure 20. If multiple pins (such as the data bus) are enabled, the measurement value is that of the first pin to start driving.



NOTES

VALID FOR ALL TEMPERATURE GRADES.

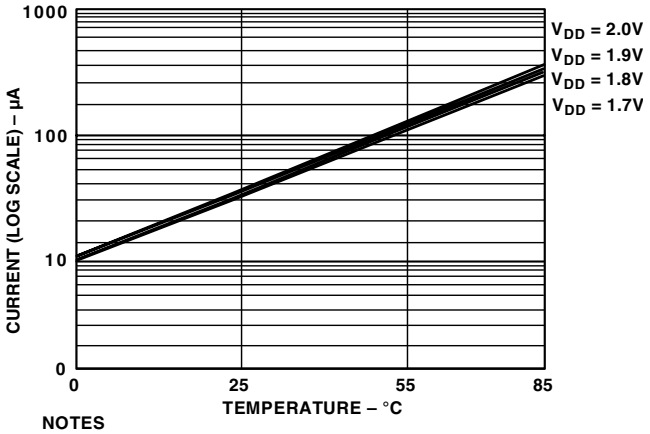
1 POWER REFLECTS DEVICE OPERATING WITH NO OUTPUT LOADS.

2 TYPICAL POWER DISSIPATION AT 1.8V OR 1.9V V_{DDINT} AND 25°C, EXCEPT WHERE SPECIFIED.

3 I_{DD} MEASUREMENT TAKEN WITH ALL INSTRUCTIONS EXECUTING FROM INTERNAL MEMORY. 50% OF THE INSTRUCTIONS ARE MULTIFUNCTION (TYPES 1, 4, 5, 12, 13, 14), 30% ARE TYPE 2 AND TYPE 6, AND 20% ARE IDLE INSTRUCTIONS.

4 IDLE REFERS TO STATE OF OPERATION DURING EXECUTION OF IDLE INSTRUCTION. DEASSERTED PINS ARE DRIVEN TO EITHER V_{DD} OR GND.

Figure 22. Power vs. Frequency



NOTES

1. REFLECTS ADSP-218xN OPERATION IN LOWEST POWER MODE. (SEE THE "SYSTEM INTERFACE" CHAPTER OF THE *ADSP-218x DSP HARDWARE REFERENCE* FOR DETAILS.)
2. CURRENT REFLECTS DEVICE OPERATING WITH NO INPUT LOADS.

Figure 23. Typical Power-Down Current

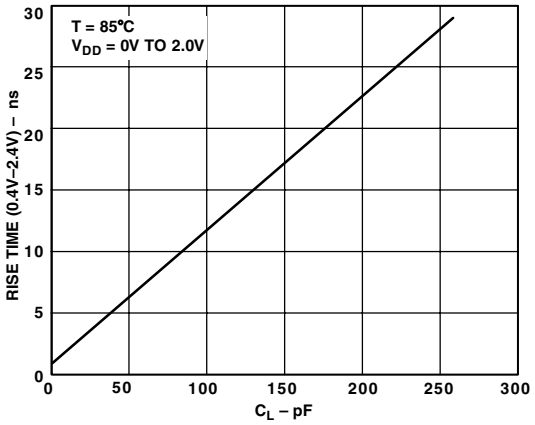


Figure 24. Typical Output Rise Time vs. Load Capacitance (at Maximum Ambient Operating Temperature)

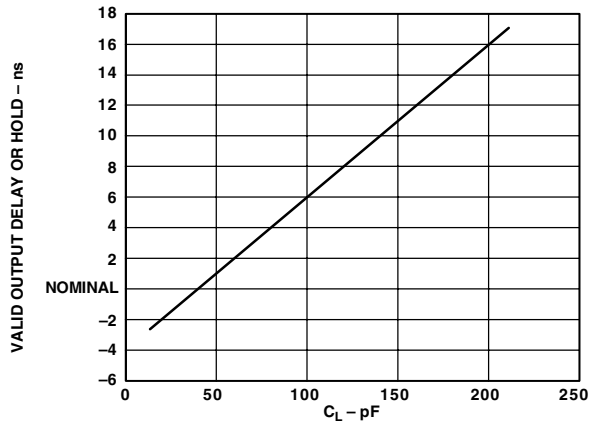

Figure 25. Typical Output Valid Delay or Hold vs. Load Capacitance, C_L (at Maximum Ambient Operating Temperature)

Interrupts and Flags

Table 16. Interrupts and Flags

Parameter		Min	Max	Unit
Timing Requirements:				
t_{IFS}	$\overline{IRQx}$, FI, or PFx Setup before CLKOUT Low[1, 2, 3, 4]	$0.25t_{CK} + 10$		ns
t_{IFH}	$\overline{IRQx}$, FI, or PFx Hold after CLKOUT High[1, 2, 3, 4]	$0.25t_{CK}$		ns
Switching Characteristics:				
t_{FOH}	Flag Output Hold after CLKOUT Low[5]	$0.5t_{CK} - 5$		ns
t_{FOD}	Flag Output Delay from CLKOUT Low[5]		$0.5t_{CK} + 4$	ns

[1] If $\overline{IRQx}$ and FI inputs meet t_{IFS} and t_{IFH} setup/hold requirements, they will be recognized during the current clock cycle; otherwise the signals will be recognized on the following cycle. (Refer to "Interrupt Controller Operation" in the *Program Control* chapter of the *ADSP-218x DSP Hardware Reference* for further information on interrupt servicing.)

[2] Edge-sensitive interrupts require pulse widths greater than 10 ns; level-sensitive interrupts must be held low until serviced.

[3] $\overline{IRQx}$ = $\overline{IRQ0}$, $\overline{IRQ1}$, $\overline{IRQ2}$, $\overline{IRQL0}$, $\overline{IRQL1}$, $\overline{IRQLE}$.

[4] PFx = PF0, PF1, PF2, PF3, PF4, PF5, PF6, PF7.

[5] Flag Outputs = PFx, FL0, FL1, FL2, FO.

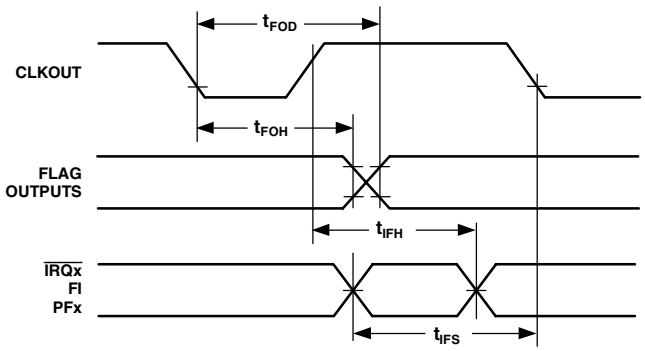

Figure 27. Interrupts and Flags

Serial Ports

Table 20. Serial Ports

Parameter		Min	Max	Unit
Timing Requirements:				
t_{SCK}	SCLK Period	30		ns
t_{SCS}	DR/TFS/RFS Setup Before SCLK Low	4		ns
t_{SCH}	DR/TFS/RFS Hold After SCLK Low	7		ns
t_{SCP}	SCLKIN Width	12		ns
Switching Characteristics:				
t_{CC}	CLKOUT High to SCLKOUT	$0.25t_{CK}$	$0.25t_{CK} + 6$	ns
t_{SCDE}	SCLK High to DT Enable	0		ns
t_{SCDV}	SCLK High to DT Valid		7	ns
t_{RH}	TFS/RFS_{OUT} Hold after SCLK High	0		ns
t_{RD}	TFS/RFS_{OUT} Delay from SCLK High		7	ns
t_{SCDH}	DT Hold after SCLK High	0		ns
t_{TDE}	TFS (Alt) to DT Enable	0		ns
t_{TDV}	TFS (Alt) to DT Valid		7	ns
t_{SCDD}	SCLK High to DT Disable		7	ns
t_{RDV}	RFS (Multichannel, Frame Delay Zero) to DT Valid		7	ns

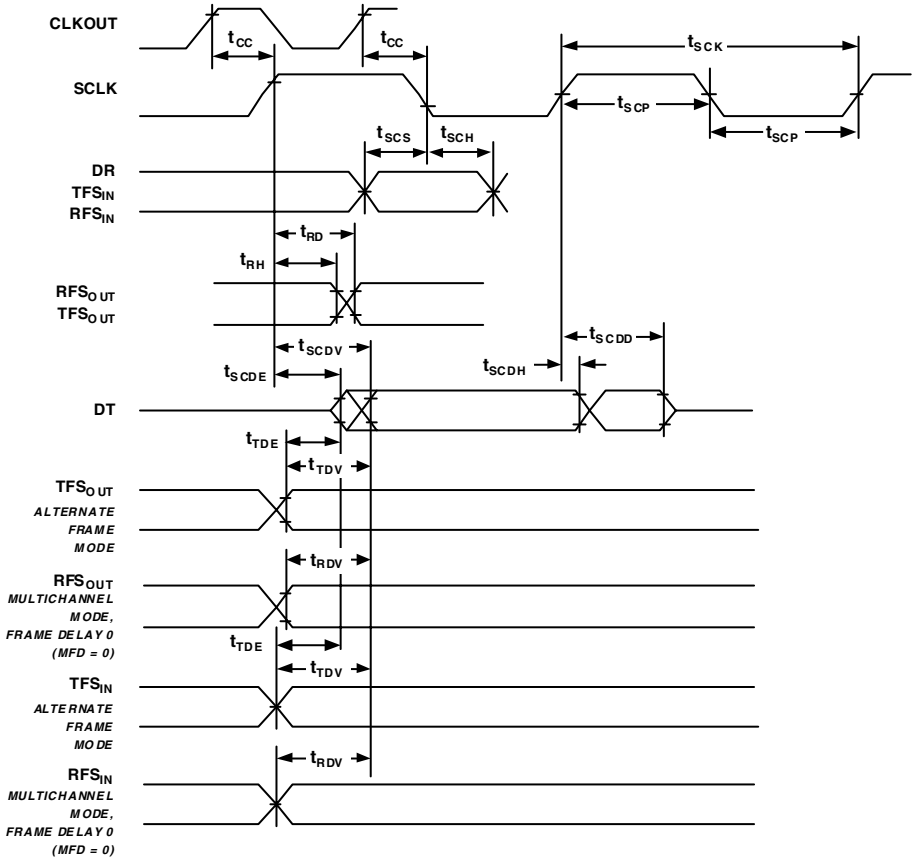

Figure 31. Serial Ports

IDMA Address Latch

Table 21. IDMA Address Latch

Parameter		Min	Max	Unit
Timing Requirements:				
t_{IALP}	Duration of Address Latch[1, 2]	10		ns
t_{IASU}	IAD15–0 Address Setup Before Address Latch End[2]	5		ns
t_{IAH}	IAD15–0 Address Hold After Address Latch End[2]	3		ns
t_{IKA}	$\overline{IACK}$ Low before Start of Address Latch[2, 3]	0		ns
t_{IALS}	Start of Write or Read After Address Latch End[2, 3]	3		ns
t_{IALD}	Address Latch Start After Address Latch End[1, 2]	2		ns

[1] Start of Address Latch = $\overline{IS}$ Low and IAL High.
[2] End of Address Latch = $\overline{IS}$ High or IAL Low.
[3] Start of Write or Read = $\overline{IS}$ Low and $\overline{IWR}$ Low or $\overline{IRD}$ Low.

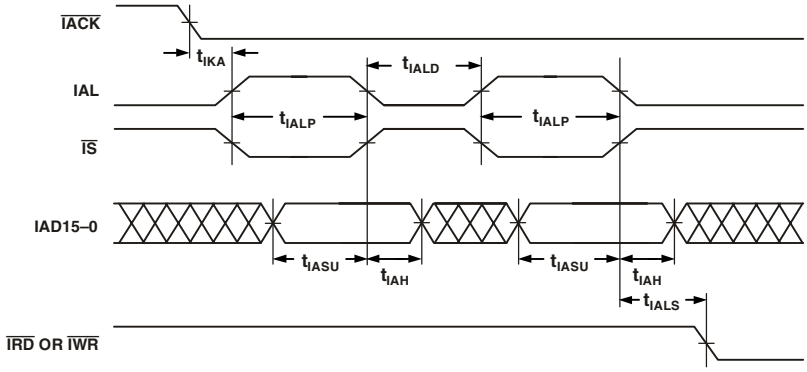

Figure 32. IDMA Address Latch

IDMA Write, Short Write Cycle

Table 22. IDMA Write, Short Write Cycle

Parameter		Min	Max	Unit
Timing Requirements:				
t_{IKW}	$\overline{IACK}$ Low Before Start of Write[1]	0		ns
t_{IWP}	Duration of Write[1, 2]	10		ns
t_{IDSU}	IAD15–0 Data Setup Before End of Write[2, 3, 4]	3		ns
t_{IDH}	IAD15–0 Data Hold After End of Write[2, 3, 4]	2		ns
Switching Characteristic:				
t_{IKHW}	Start of Write to $\overline{IACK}$ High		10	ns

[1] Start of Write = $\overline{IS}$ Low and $\overline{IWR}$ Low.
[2] End of Write = $\overline{IS}$ High or $\overline{IWR}$ High.
[3] If Write Pulse ends before $\overline{IACK}$ Low, use specifications t_{IDSU}, t_{IDH}.
[4] If Write Pulse ends after $\overline{IACK}$ Low, use specifications t_{IKSU}, t_{IKH}.

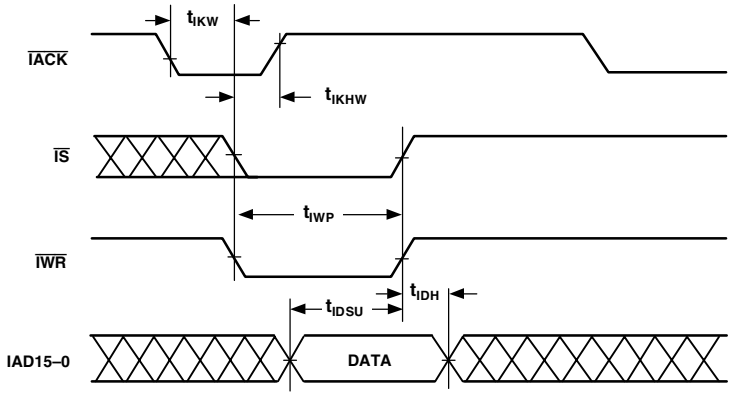

Figure 33. IDMA Write, Short Write Cycle

IDMA Read, Short Read Cycle in Short Read Only Mode

Table 26. IDMA Read, Short Read Cycle in Short Read Only Mode

Parameter[1]		Min	Max	Unit
Timing Requirements:				
t_{IKR}	$\overline{IACK}$ Low Before Start of Read[2]	0		ns
t_{IRP}	Duration of Read[3]	10		ns
Switching Characteristics:				
t_{IKHR}	$\overline{IACK}$ High After Start of Read[2]		10	ns
t_{IKDH}	IAD15–0 Previous Data Hold After End of Read[3]	0		ns
t_{IKDD}	IAD15–0 Previous Data Disabled After End of Read[3]		10	ns
t_{IRDE}	IAD15–0 Previous Data Enabled After Start of Read	0		ns
t_{IRDV}	IAD15–0 Previous Data Valid After Start of Read		10	ns

[1] Short Read Only is enabled by setting Bit 14 of the IDMA overlay Register to 1 (0x3FE7). Short Read Only can be enabled by the processor core writing to the register or by an external host writing to the register. Disabled by default.
[2] Start of Read = $\overline{IS}$ Low and $\overline{IRD}$ Low. Previous data remains until end of read.
[3] End of Read = $\overline{IS}$ High or $\overline{IRD}$ High.

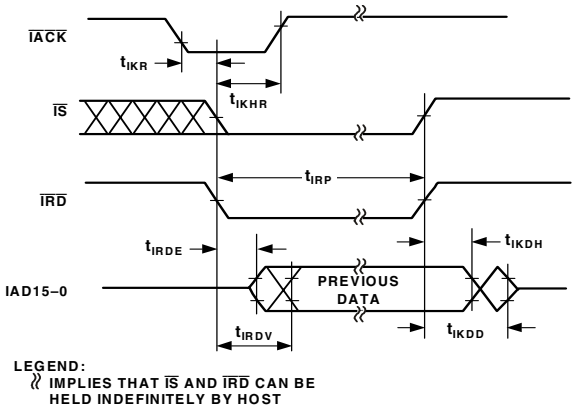

Figure 37. IDMA Read, Short Read Cycle in Short Read Only Mode

SURFACE MOUNT DESIGN

Table 29 is provided as an aid to PCB design. For industry-standard design recommendations, refer to IPC-7351, *Generic Requirements for Surface Mount Design and Land Pattern Standard*.
