
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	PIC
Core Size	8-Bit
Speed	4MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, POR, WDT
Number of I/O	13
Program Memory Size	896B (512 x 14)
Program Memory Type	OTP
EEPROM Size	128 x 8
RAM Size	96 x 8
Voltage - Supply (Vcc/Vdd)	2.5V ~ 5.5V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	18-SOIC (0.295", 7.50mm Width)
Supplier Device Package	18-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16lce623t-04e-so

NOTES:

3.0 ARCHITECTURAL OVERVIEW

The high performance of the PIC16CE62X family can be attributed to a number of architectural features commonly found in RISC microprocessors. To begin with, the PIC16CE62X uses a Harvard architecture in which program and data are accessed from separate memories using separate buses. This improves bandwidth over traditional von Neumann architecture where program and data are fetched from the same memory. Separating program and data memory further allows instructions to be sized differently than 8-bit wide data word. Instruction opcodes are 14-bits wide making it possible to have all single word instructions. A 14-bit wide program memory access bus fetches a 14-bit instruction in a single cycle. A two-stage pipeline overlaps fetch and execution of instructions. Consequently, all instructions (35) execute in a single-cycle (200 ns @ 20 MHz) except for program branches.

The table below lists program memory (EPROM), data memory (RAM) and non-volatile memory (EEPROM) for each PIC16CE62X device.

Device	Program Memory	RAM Data Memory	EEPROM Data Memory
PIC16CE623	512x14	96x8	128x8
PIC16CE624	1Kx14	96x8	128x8
PIC16CE625	2Kx14	128x8	128x8

The PIC16CE62X can directly or indirectly address its register files or data memory. All special function registers including the program counter are mapped in the data memory. The PIC16CE62X family has an orthogonal (symmetrical) instruction set that makes it possible to carry out any operation on any register using any addressing mode. This symmetrical nature and lack of ‘special optimal situations’ make programming with the PIC16CE62X simple yet efficient. In addition, the learning curve is reduced significantly.

The PIC16CE62X devices contain an 8-bit ALU and working register. The ALU is a general purpose arithmetic unit. It performs arithmetic and Boolean functions between data in the working register and any register file.

The ALU is 8 bits wide and capable of addition, subtraction, shift and logical operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. In two-operand instructions, typically one operand is the working register (W register). The other operand is a file register or an immediate constant. In single operand instructions, the operand is either the W register or a file register.

The W register is an 8-bit working register used for ALU operations. It is not an addressable register.

Depending on the instruction executed, the ALU may affect the values of the Carry (C), Digit Carry (DC), and Zero (Z) bits in the STATUS register. The C and DC bits operate as a $\overline{\text{Borrow}}$ and $\overline{\text{Digit}}$ $\overline{\text{Borrow}}$ out bit respectively, bit in subtraction. See the SUBLW and SUBWF instructions for examples.

A simplified block diagram is shown in Figure 3-1, with a description of the device pins in Table 3-1.

TABLE 3-1: PIC16CE62X PINOUT DESCRIPTION

Name	DIP/ SOIC Pin #	SSOP Pin #	I/O/P Type	Buffer Type	Description
OSC1/CLKIN	16	18	I	ST/CMOS	Oscillator crystal input/external clock source input.
OSC2/CLKOUT	15	17	O	—	Oscillator crystal output. Connects to crystal or resonator in crystal oscillator mode. In RC mode, OSC2 pin outputs CLKOUT which has 1/4 the frequency of OSC1, and denotes the instruction cycle rate.
$\overline{MCLR}$/VPP	4	4	I/P	ST	Master clear (reset) input/programming voltage input. This pin is an active low reset to the device.
					PORTA is a bi-directional I/O port.
RA0/AN0	17	19	I/O	ST	Analog comparator input
RA1/AN1	18	20	I/O	ST	Analog comparator input
RA2/AN2/VREF	1	1	I/O	ST	Analog comparator input or VREF output
RA3/AN3	2	2	I/O	ST	Analog comparator input /output
RA4/T0CKI	3	3	I/O	ST	Can be selected to be the clock input to the Timer0 timer/counter or a comparator output. Output is open drain type.
					PORTB is a bi-directional I/O port. PORTB can be software programmed for internal weak pull-up on all inputs.
RB0/INT	6	7	I/O	TTL/ST(1)	RB0/INT can also be selected as an external interrupt pin.
RB1	7	8	I/O	TTL	
RB2	8	9	I/O	TTL	
RB3	9	10	I/O	TTL	
RB4	10	11	I/O	TTL	Interrupt on change pin.
RB5	11	12	I/O	TTL	Interrupt on change pin.
RB6	12	13	I/O	TTL/ST(2)	Interrupt on change pin. Serial programming clock.
RB7	13	14	I/O	TTL/ST(2)	Interrupt on change pin. Serial programming data.
VSS	5	5,6	P	—	Ground reference for logic and I/O pins.
VDD	14	15,16	P	—	Positive supply for logic and I/O pins.

Legend: O = output I/O = input/output P = power
— = Not used I = Input ST = Schmitt Trigger input
TTL = TTL input

Note 1: This buffer is a Schmitt Trigger input when configured as the external interrupt.
Note 2: This buffer is a Schmitt Trigger input when used in serial programming mode.

4.2.2.1 STATUS REGISTER

The STATUS register, shown in Register 4-1, contains the arithmetic status of the ALU, the RESET status and the bank select bits for data memory.

The STATUS register can be the destination for any instruction, like any other register. If the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. Furthermore, the $\overline{TO}$ and $\overline{PD}$ bits are not writable. Therefore, the result of an instruction with the STATUS register as destination may be different than intended.

For example, CLRF STATUS will clear the upper-three bits and set the Z bit. This leaves the status register as 000uu1uu (where u = unchanged).

It is recommended, therefore, that only BCF, BSF, SWAPF and MOVWF instructions are used to alter the STATUS register, because these instructions do not affect any status bit. For other instructions, not affecting any status bits, see the “Instruction Set Summary”.

Note 1:	The IRP and RP1 bits (STATUS<7:6>) are not used by the PIC16CE62X and should be programmed as ’0'. Use of these bits as general purpose R/W bits is NOT recommended, since this may affect upward compatibility with future products.
Note 2:	The C and DC bits operate as a $\overline{\text{Borrow}}$ and $\overline{\text{Digit Borrow}}$ out bit, respectively, in subtraction. See the SUBLW and SUBWF instructions for examples.

REGISTER 4-1: STATUS REGISTER (ADDRESS 03H OR 83H)

Reserved	Reserved	R/W-0	R-1	R-1	R/W-x	R/W-x	R/W-x
IRP	RP1	RP0	$\overline{TO}$	$\overline{PD}$	Z	DC	C
bit7							bit0

R = Readable bit
W = Writable bit
U = Unimplemented bit, read as ‘0’
-n = Value at POR reset
-x = Unknown at POR reset

bit 7: IRP: The IRP bit is reserved on the PIC16CE62X, always maintain this bit clear.

bit 6:5 RP<1:O>: Register Bank Select bits (used for direct addressing)
11 = Bank 3 (180h - 1FFh)
10 = Bank 2 (100h - 17Fh)
01 = Bank 1 (80h - FFh)
00 = Bank 0 (00h - 7Fh)
Each bank is 128 bytes. The RP1 bit is reserved, always maintain this bit clear.

bit 4: $\overline{TO}$: Time-out bit
1 = After power-up, CLRWDT instruction, or SLEEP instruction
0 = A WDT time-out occurred

bit 3: $\overline{PD}$: Power-down bit
1 = After power-up or by the CLRWDT instruction
0 = By execution of the SLEEP instruction

bit 2: Z: Zero bit
1 = The result of an arithmetic or logic operation is zero
0 = The result of an arithmetic or logic operation is not zero

bit 1: DC: Digit carry/$\overline{\text{borrow}}$ bit (ADDWF, ADDLW, SUBLW, SUBWF instructions) (for $\overline{\text{borrow}}$ the polarity is reversed)
1 = A carry-out from the 4th low order bit of the result occurred
0 = No carry-out from the 4th low order bit of the result

bit 0: C: Carry/$\overline{\text{borrow}}$ bit (ADDWF, ADDLW, SUBLW, SUBWF instructions)
1 = A carry-out from the most significant bit of the result occurred
0 = No carry-out from the most significant bit of the result occurred
Note: For $\overline{\text{borrow}}$ the polarity is reversed. A subtraction is executed by adding the two’s complement of the second operand. For rotate (RRF, RLF) instructions, this bit is loaded with either the high or low order bit of the source register.

7.0 TIMER0 MODULE

The Timer0 module timer/counter has the following features:

- 8-bit timer/counter
- Readable and writable
- 8-bit software programmable prescaler
- Internal or external clock select
- Interrupt on overflow from FFh to 00h
- Edge select for external clock

Figure 7-1 is a simplified block diagram of the Timer0 module.

Timer mode is selected by clearing the T0CS bit (OPTION<5>). In timer mode, the TMR0 will increment every instruction cycle (without prescaler). If Timer0 is written, the increment is inhibited for the following two cycles (Figure 7-2 and Figure 7-3). The user can work around this by writing an adjusted value to TMR0.

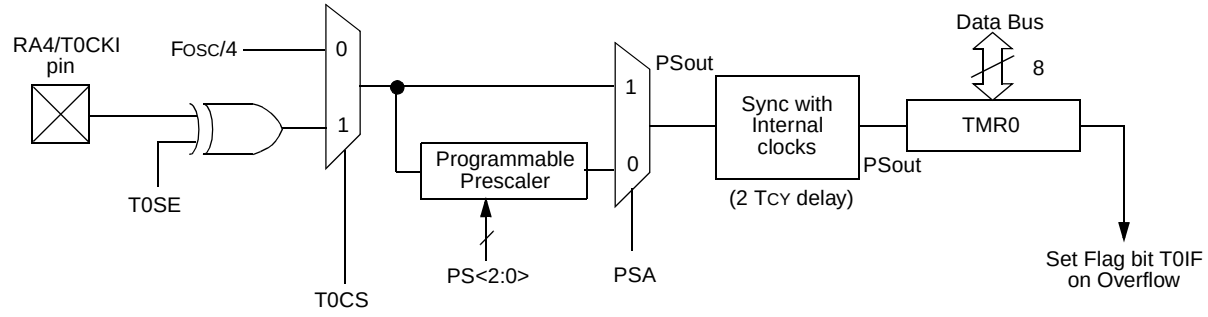
Counter mode is selected by setting the T0CS bit. In this mode Timer0 will increment either on every rising or falling edge of pin RA4/T0CKI. The incrementing edge is determined by the source edge (T0SE) control bit (OPTION<4>). Clearing the T0SE bit selects the rising edge. Restrictions on the external clock input are discussed in detail in Section 7.2.

The prescaler is shared between the Timer0 module and the Watchdog Timer. The prescaler assignment is controlled in software by the control bit PSA (OPTION<3>). Clearing the PSA bit will assign the prescaler to Timer0. The prescaler is not readable or writable. When the prescaler is assigned to the Timer0 module, prescale value of 1:2, 1:4, ..., 1:256 are selectable. Section 7.3 details the operation of the prescaler.

7.1 Timer0 Interrupt

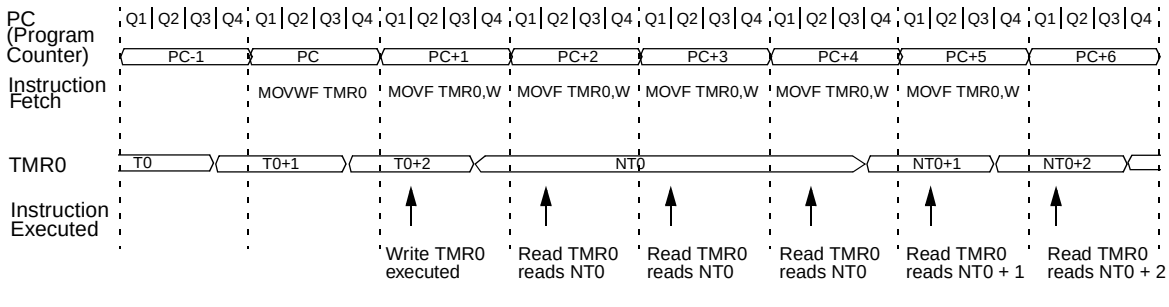
Timer0 interrupt is generated when the TMR0 register timer/counter overflows from FFh to 00h. This overflow sets the T0IF bit. The interrupt can be masked by clearing the T0IE bit (INTCON<5>). The T0IF bit (INTCON<2>) must be cleared in software by the Timer0 module interrupt service routine before re-enabling this interrupt. The Timer0 interrupt cannot wake the processor from SLEEP since the timer is shut off during SLEEP. See Figure 7-4 for Timer0 interrupt timing.

FIGURE 7-1: TIMER0 BLOCK DIAGRAM



Note 1: Bits T0SE, T0CS, PS2, PS1, PS0 and PSA are located in the OPTION register.
2: The prescaler is shared with Watchdog Timer (Figure 7-6)

FIGURE 7-2: TIMER0 (TMR0) TIMING: INTERNAL CLOCK/NO PRESCALER



7.3.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control (i.e., it can be changed “on-the-fly” during program execution). To avoid an unintended device RESET, the following instruction sequence (Example 7-1) must be executed when changing the prescaler assignment from Timer0 to WDT.

EXAMPLE 7-1: CHANGING PRESCALER (TIMER0 o WDT)

```
1.BCF     STATUS, RP0   ;Skip if already in
                        ; Bank 0
2.CLRWDT                ;Clear WDT
3.CLRF    TMR0          ;Clear TMR0 & Prescaler
4.BSF     STATUS, RP0   ;Bank 1
5.MOVLW   '00101111'b   ;These 3 lines (5, 6, 7)
6.MOVWF   OPTION        ; are required only if
                        ; desired PS<2:0> are
7.CLRWDT                ; 000 or 001
8.MOVLW   '00101xxx'b   ;Set Postscaler to
9.MOVWF   OPTION        ; desired WDT rate
10.BCF    STATUS, RP0   ;Return to Bank 0
```

To change prescaler from the WDT to the TMR0 module, use the sequence shown in Example 7-2. This precaution must be taken even if the WDT is disabled.

EXAMPLE 7-2: CHANGING PRESCALER (WDT o TIMER0)

```
CLRWDT                  ;Clear WDT and
                        ;prescaler
BSF     STATUS, RP0
MOVLW   b'xxxx0xxx'     ;Select TMR0, new
                        ;prescale value and
                        ;clock source
MOVWF   OPTION_REG
BCF     STATUS, RP0
```

TABLE 7-1: REGISTERS ASSOCIATED WITH TIMER0

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on: POR	Value on All Other Resets
01h	TMR0	Timer0 module register								xxxx xxxx	uuuu uuuu
0Bh/8Bh	INTCON	GIE	PEIE	T0IE	INTE	RBIE	T0IF	INTF	RBIF	0000 000x	0000 000u
81h	OPTION	$\overline{\text{RBPU}}$	INTEDG	T0CS	T0SE	PSA	PS2	PS1	PS0	1111 1111	1111 1111
85h	TRISA	—	—	—	TRISA4	TRISA3	TRISA2	TRISA1	TRISA0	---1 1111	---1 1111

Legend: — = Unimplemented locations, read as ‘0’, x = unknown, u = unchanged.

Note: Shaded bits are not used by TMR0 module.

The code example in Example 8-1 depicts the steps required to configure the comparator module. RA3 and RA4 are configured as digital output. RA0 and RA1 are configured as the V- inputs and RA2 as the V+ input to both comparators.

EXAMPLE 8-1: INITIALIZING COMPARATOR MODULE

```
FLAG_REG EQU     0X20
CLRF     FLAG_REG    ;Init flag register
CLRF     PORTA       ;Init PORTA
MOVF     CMCON,W     ;Move comparator contents to W
ANDLW    0xC0        ;Mask comparator bits
IORWF    FLAG_REG,F  ;Store bits in flag register
MOVLW    0x03        ;Init comparator mode
MOVWF    CMCON       ;CM<2:0> = 011
BSF      STATUS,RP0  ;Select Bank1
MOVLW    0x07        ;Initialize data direction
MOVWF    TRISA       ;Set RA<2:0> as inputs
                     ;RA<4:3> as outputs
                     ;TRISA<7:5> always read '0'
BCF      STATUS,RP0  ;Select Bank 0
CALL     DELAY 10    ;10 Ts delay
MOVF     CMCON,F     ;Read CMCON to end change condition
BCF      PIR1,CMIF   ;Clear pending interrupts
BSF      STATUS,RP0  ;Select Bank 1
BSF      PIE1,CMIE   ;Enable comparator interrupts
BCF      STATUS,RP0  ;Select Bank 0
BSF      INTCON,PEIE ;Enable peripheral interrupts
BSF      INTCON,GIE  ;Global interrupt enable
```

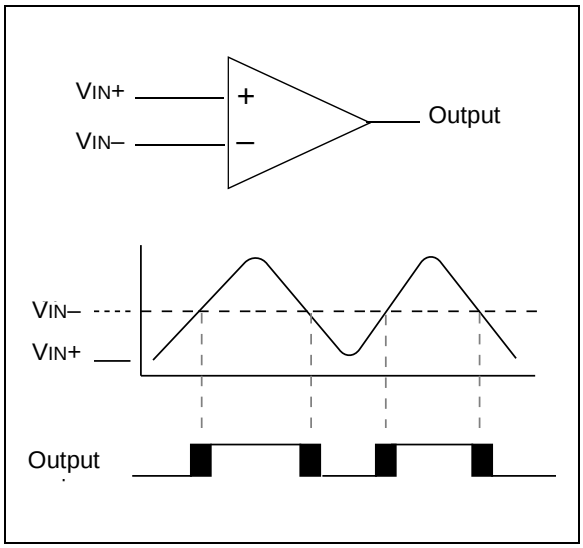
8.2 Comparator Operation

A single comparator is shown in Figure 8-2 along with the relationship between the analog input levels and the digital output. When the analog input at $V_{IN}+$ is less than the analog input $V_{IN}–$, the output of the comparator is a digital low level. When the analog input at $V_{IN}+$ is greater than the analog input $V_{IN}–$, the output of the comparator is a digital high level. The shaded areas of the output of the comparator in Figure 8-2 represent the uncertainty due to input offsets and response time.

8.3 Comparator Reference

An external or internal reference signal may be used depending on the comparator operating mode. The analog signal that is present at $V_{IN}–$ is compared to the signal at $V_{IN}+$, and the digital output of the comparator is adjusted accordingly (Figure 8-2).

FIGURE 8-2: SINGLE COMPARATOR



8.3.1 EXTERNAL REFERENCE SIGNAL

When external voltage references are used, the comparator module can be configured to have the comparators operate from the same or different reference sources. However, threshold detector applications may require the same reference. The reference signal must be between V_{SS} and V_{DD} and can be applied to either pin of the comparator(s).

8.3.2 INTERNAL REFERENCE SIGNAL

The comparator module also allows the selection of an internally generated voltage reference for the comparators. Section 13, Instruction Sets, contains a detailed description of the Voltage Reference Module that provides this signal. The internal reference signal is used when the comparators are in mode CM<2:0>=010 (Figure 8-1). In this mode, the internal voltage reference is applied to the $V_{IN}+$ pin of both comparators.

8.4 Comparator Response Time

Response time is the minimum time, after selecting a new reference voltage or input source, before the comparator output has a valid level. If the internal reference is changed, the maximum delay of the internal voltage reference must be considered when using the comparator outputs, otherwise the maximum delay of the comparators should be used (Table 13-1).

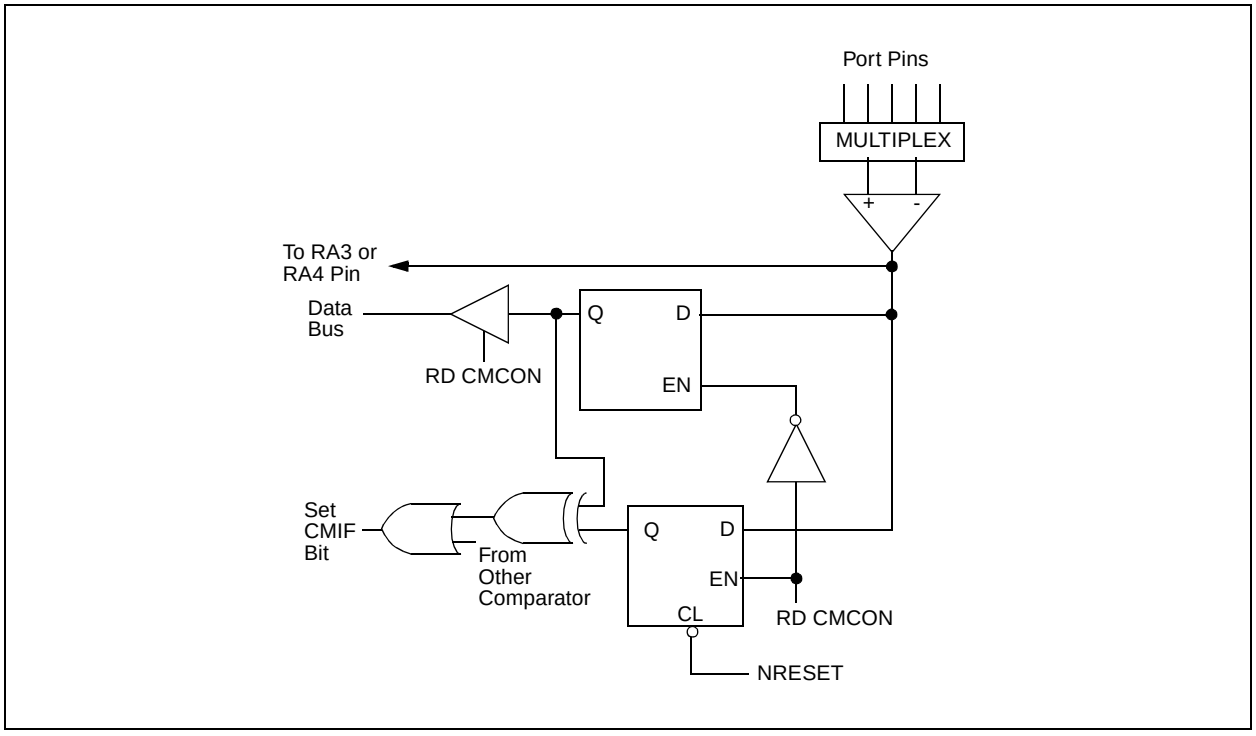
8.5 Comparator Outputs

The comparator outputs are read through the CMCON register. These bits are read only. The comparator outputs may also be directly output to the RA3 and RA4 I/O pins. When the CM<2:0> = 110, multiplexors in the output path of the RA3 and RA4 pins will switch and the output of each pin will be the unsynchronized output of the comparator. The uncertainty of each of the comparators is related to the input offset voltage and the response time given in the specifications. Figure 8-3 shows the comparator output block diagram.

The TRISA bits will still function as an output enable/disable for the RA3 and RA4 pins while in this mode.

Note 1:	When reading the PORT register, all pins configured as analog inputs will read as a '0'. Pins configured as digital inputs will convert an analog input according to the Schmitt Trigger input specification.
2:	Analog levels on any pin that is defined as a digital input may cause the input buffer to consume more current than is specified.

FIGURE 8-3: COMPARATOR OUTPUT BLOCK DIAGRAM



EXAMPLE 9-1: VOLTAGE REFERENCE CONFIGURATION

```
MOVLW    0x02          ; 4 Inputs Muxed
MOVWF    CMCON           ; to 2 comps.
BSF      STATUS,RP0    ; go to Bank 1
MOVLW    0x07          ; RA3-RA0 are
MOVWF    TRISA         ; outputs
MOVLW    0xA6          ; enable V   REF
MOVWF    VRCON           ; low range
                       ; set V    R<3:0>=6
BCF      STATUS,RP0    ; go to Bank 0
CALL     DELAY10       ; 10   s delay
```

9.2 Voltage Reference Accuracy/Error

The full range of VSS to VDD cannot be realized due to the construction of the module. The transistors on the top and bottom of the resistor ladder network (Figure 9-1) keep VREF from approaching VSS or VDD. The Voltage Reference is VDD derived and therefore, the VREF output changes with fluctuations in VDD. The absolute accuracy of the Voltage Reference can be found in Table 13-2.

9.3 Operation During Sleep

When the device wakes up from sleep through an interrupt or a Watchdog Timer time-out, the contents of the VRCON register are not affected. To minimize current consumption in SLEEP mode, the Voltage Reference should be disabled.

9.4 Effects of a Reset

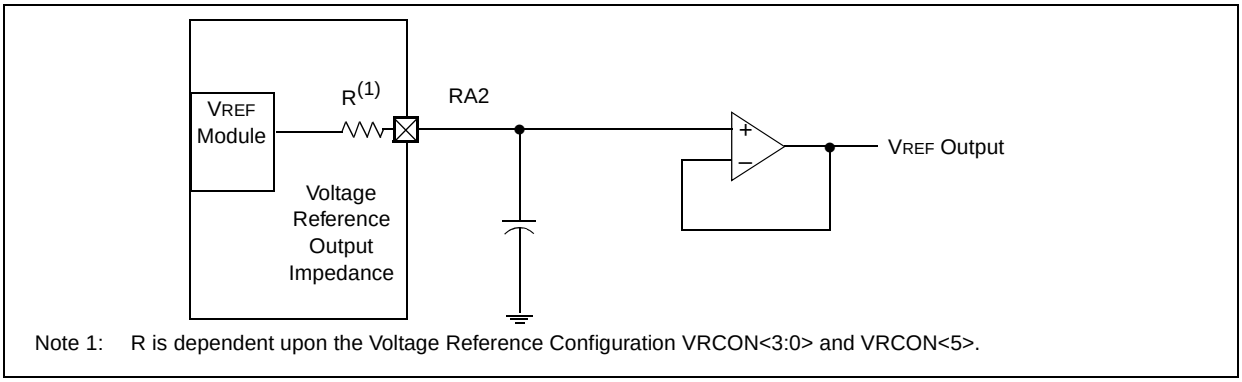
A device reset disables the Voltage Reference by clearing bit VREN (VRCON<7>). This reset also disconnects the reference from the RA2 pin by clearing bit VROE (VRCON<6>) and selects the high voltage range by clearing bit VRR (VRCON<5>). The VREF value select bits, VRCON<3:0>, are also cleared.

9.5 Connection Considerations

The Voltage Reference Module operates independently of the comparator module. The output of the reference generator may be connected to the RA2 pin if the TRISA<2> bit is set and the VROE bit, VRCON<6>, is set. Enabling the Voltage Reference output onto the RA2 pin with an input signal present will increase current consumption. Connecting RA2 as a digital output with VREF enabled will also increase current consumption.

The RA2 pin can be used as a simple D/A output with limited drive capability. Due to the limited drive capability, a buffer must be used in conjunction with the Voltage Reference output for external connections to VREF. Figure 9-2 shows an example buffering technique.

FIGURE 9-2: VOLTAGE REFERENCE OUTPUT BUFFER EXAMPLE



Note 1: R is dependent upon the Voltage Reference Configuration VRCON<3:0> and VRCON<5>.

TABLE 9-1: REGISTERS ASSOCIATED WITH VOLTAGE REFERENCE

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value On POR / BOD	Value On All Other Resets
9Fh	VRCON	VREN	VROE	VRR	—	VR3	VR2	VR1	VR0	000- 0000	000- 0000
1Fh	CMCON	C2OUT	C1OUT	—	—	CIS	CM2	CM1	CM0	00-- 0000	00-- 0000
85h	TRISA	—	—	—	TRISA4	TRISA3	TRISA2	TRISA1	TRISA0	---1 1111	---1 1111

Legend: - = Unimplemented, read as "0"

10.0 SPECIAL FEATURES OF THE CPU

Special circuits to deal with the needs of real time applications are what sets a microcontroller apart from other processors. The PIC16CE62X family has a host of such features intended to maximize system reliability, minimize cost through elimination of external components, provide power saving operating modes and offer code protection.

These are:

1. OSC selection
2. Reset
   Power-on Reset (POR)
   Power-up Timer (PWRT)
   Oscillator Start-Up Timer (OST)
   Brown-out Reset (BOD)
3. Interrupts
4. Watchdog Timer (WDT)
5. SLEEP
6. Code protection
7. ID Locations
8. In-circuit serial programming

The PIC16CE62X has a Watchdog Timer which is controlled by configuration bits. It runs off its own RC oscillator for added reliability. There are two timers that offer necessary delays on power-up. One is the Oscillator Start-up Timer (OST), intended to keep the chip in reset until the crystal oscillator is stable. The other is the Power-up Timer (PWRT), which provides a fixed delay of 72 ms (nominal) on power-up only, and is designed to keep the part in reset while the power supply stabilizes. There is also circuitry to reset the device if a brown-out occurs, which provides at least a 72 ms reset. With these three functions on-chip, most applications need no external reset circuitry.

The SLEEP mode is designed to offer a very low current power-down mode. The user can wake-up from SLEEP through external reset, Watchdog Timer wake-up or through an interrupt. Several oscillator options are also made available to allow the part to fit the application. The RC oscillator option saves system cost, while the LP crystal option saves power. A set of configuration bits are used to select various options.

11.1 Instruction Descriptions

ADDLW Add Literal and W

Syntax: [*label*] ADDLW k

Operands: 0 dk d255

Operation: (W) + k o (W)

Status Affected: C, DC, Z

Encoding:

11	111x	kkkk	kkkk

Description: The contents of the W register are added to the eight bit literal 'k' and the result is placed in the W register.

Words: 1

Cycles: 1

Example

```
ADDLW   0x15
Before Instruction
        W  =  0x10
After Instruction
        W  =  0x25
```

ANDLW AND Literal with W

Syntax: [*label*] ANDLW k

Operands: 0 dk d255

Operation: (W) .AND. (k) o (W)

Status Affected: Z

Encoding:

11	1001	kkkk	kkkk

Description: The contents of W register are AND'ed with the eight bit literal 'k'. The result is placed in the W register.

Words: 1

Cycles: 1

Example

```
ANDLW   0x5F
Before Instruction
        W  =  0xA3
After Instruction
        W  =  0x03
```

ADDWF Add W and f

Syntax: [*label*] ADDWF f,d

Operands: 0 df d127
d • > @

Operation: (W) + (f) o (dest)

Status Affected: C, DC, Z

Encoding:

00	0111	dfff	ffff

Description: Add the contents of the W register with register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'.

Words: 1

Cycles: 1

Example

```
ADDWF   FSR, 0
Before Instruction
        W  =  0x17
        FSR =  0xC2
After Instruction
        W  =  0xD9
        FSR =  0xC2
```

ANDWF AND W with f

Syntax: [*label*] ANDWF f,d

Operands: 0 df d127
d • > @

Operation: (W) .AND. (f) o (dest)

Status Affected: Z

Encoding:

00	0101	dfff	ffff

Description: AND the W register with register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'.

Words: 1

Cycles: 1

Example

```
ANDWF   FSR, 1
Before Instruction
        W  =  0x17
        FSR =  0xC2
After Instruction
        W  =  0x17
        FSR =  0x02
```
