Welcome to [E-XFL.COM](#)**Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	3000
Number of Logic Elements/Cells	12000
Total RAM Bits	589824
Number of I/O	197
Number of Gates	-
Voltage - Supply	1.045V ~ 1.155V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	381-FBGA
Supplier Device Package	381-CABGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe5u-12f-6bg381i

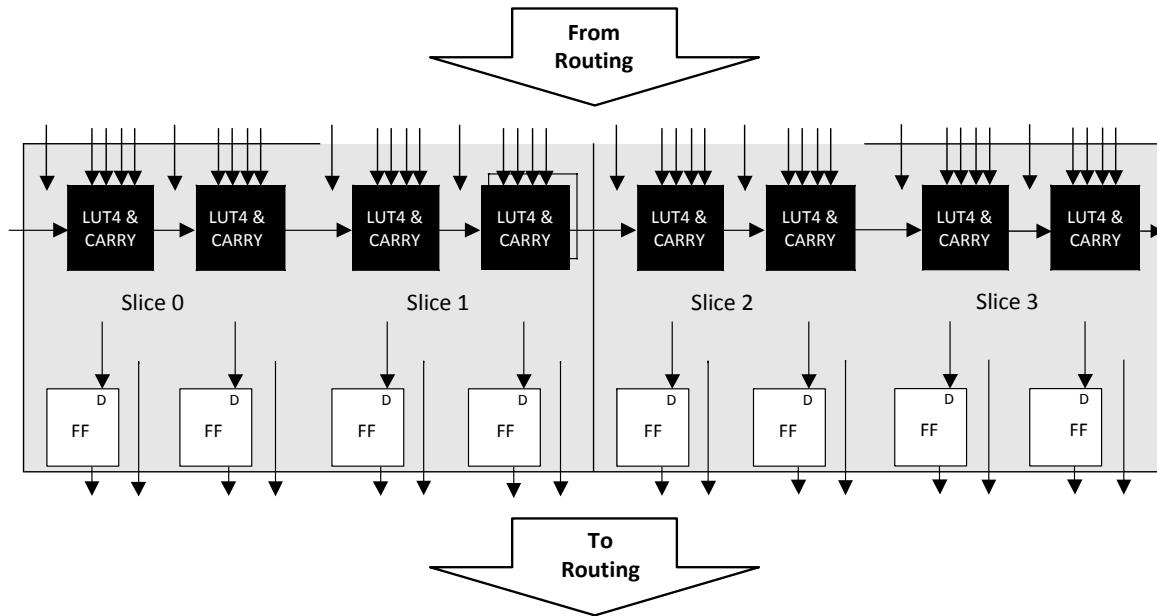

Figure 2.2. PFU Diagram

2.2.1. Slice

Each slice contains two LUT4s feeding two registers. In Distributed SRAM mode, Slice 0 through Slice 2 are configured as distributed memory, and Slice 3 is used as Logic or ROM. [Table 2.1](#) shows the capability of the slices along with the operation modes they enable. In addition, each PFU contains logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7 and LUT8. There is control logic to perform set/reset functions (programmable as synchronous/asynchronous), clock select, chip-select and wider RAM/ROM functions.

Table 2.1. Resources and Modes Available per Slice

Slice	PFU (Used in Distributed SRAM)		PFU (Not used as Distributed SRAM)	
	Resources	Modes	Resources	Modes
Slice 0	2 LUT4s and 2 Registers	RAM	2 LUT4s and 2 Registers	Logic, Ripple, ROM
Slice 1	2 LUT4s and 2 Registers	RAM	2 LUT4s and 2 Registers	Logic, Ripple, ROM
Slice 2	2 LUT4s and 2 Registers	RAM	2 LUT4s and 2 Registers	Logic, Ripple, ROM
Slice 3	2 LUT4s and 2 Registers	Logic, Ripple, ROM	2 LUT4s and 2 Registers	Logic, Ripple, ROM

[Figure 2.3](#) shows an overview of the internal logic of the slice. The registers in the slice can be configured for positive/negative and edge triggered or level sensitive clocks.

Each slice has 14 input signals, 13 signals from routing and one from the carry-chain (from the adjacent slice or PFU). There are five outputs, four to routing and one to carry-chain (to the adjacent PFU). There are two inter slice/ PFU output signals that are used to support wider LUT functions, such as LUT6, LUT7 and LUT8. [Table 2.2](#) and [Figure 2.3](#) list the signals associated with all the slices. [Figure 2.4](#) on page 16 shows the connectivity of the inter-slice/PFU signals that support LUT5, LUT6, LUT7 and LUT8.

2.3. Routing

There are many resources provided in the ECP5/ECP5-5G devices to route signals individually or as busses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The ECP5/ECP5-5G family has an enhanced routing architecture that produces a compact design. The Diamond design software tool suites take the output of the synthesis tool and places and routes the design.

2.4. Clocking Structure

ECP5/ECP5-5G clocking structure consists of clock synthesis blocks (sysCLOCK PLL); balanced clock tree networks (PCLK and ECLK trees); and efficient clock logic modules (CLOCK DIVIDER and Dynamic Clock Select (DCS), Dynamic Clock Control (DCC) and DLL). All of these functions are described below.

2.4.1. sysCLOCK PLL

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. The devices in the ECP5/ECP5-5G family support two to four full-featured General Purpose PLLs. The sysCLOCK PLLs provide the ability to synthesize clock frequencies.

The architecture of the PLL is shown in [Figure 2.5](#). A description of the PLL functionality follows.

CLKI is the reference frequency input to the PLL and its source can come from two different external CLK inputs or from internal routing. A non-glitchless 2-to-1 input multiplexor is provided to dynamically select between two different external reference clock sources. The CLKI input feeds into the input Clock Divider block.

CLKFB is the feedback signal to the PLL which can come from internal feedback path, routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The PLL has four clock outputs CLKOP, CLKOS, CLKOS2 and CLKOS3. Each output has its own output divider, thus allowing the PLL to generate different frequencies for each output. The output dividers can have a value from 1 to 128. The CLKOP, CLKOS, CLKOS2, and CLKOS3 outputs can all be used to drive the primary clock network. Only CLKOP and CLKOS outputs can go to the edge clock network.

The setup and hold times of the device can be improved by programming a phase shift into the CLKOS, CLKOS2, and CLKOS3 output clocks which will advance or delay the output clock with reference to the CLKOP output clock. This phase shift can be either programmed during configuration or can be adjusted dynamically using the PHASESEL, PHASEDIR, PHASESTEP, and PHASELOADREG ports.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected.

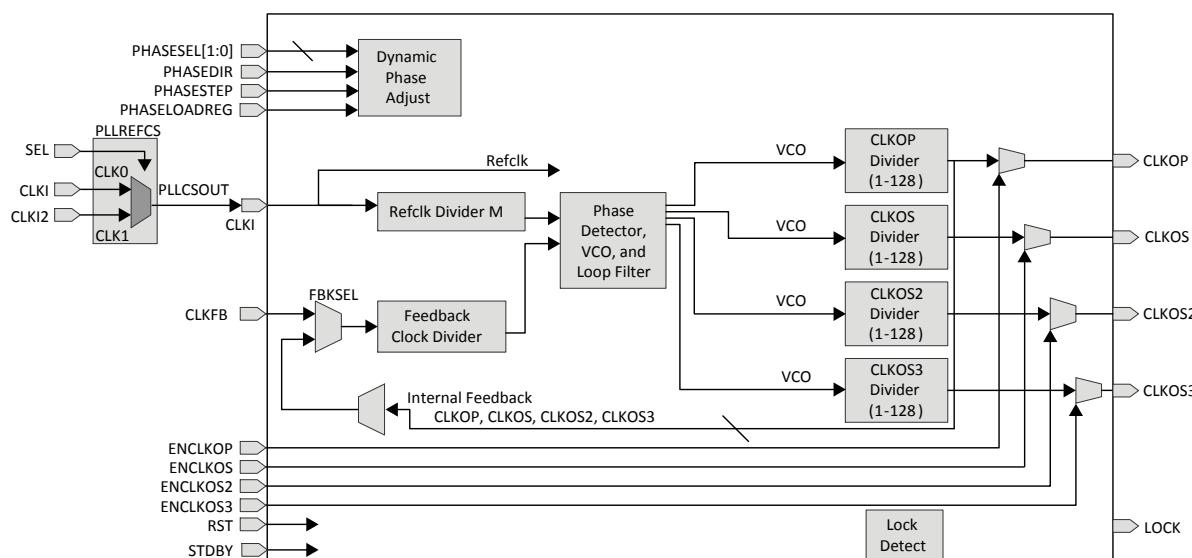

Figure 2.5. General Purpose PLL Diagram

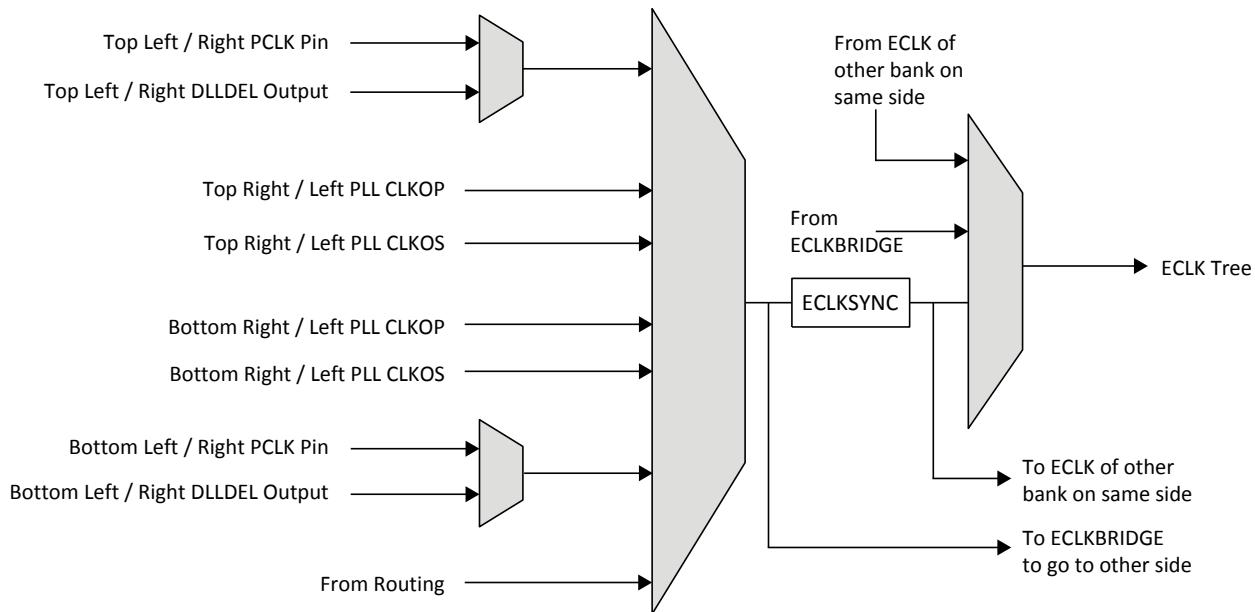

Figure 2.8. Edge Clock Sources per Bank

The edge clocks have low injection delay and low skew. They are used for DDR Memory or Generic DDR interfaces. For detailed information on Edge Clock connections, refer to [ECP5 and ECP5-5G sysClock PLL/DLL Design and Usage Guide \(TN1263\)](#).

2.6. Clock Dividers

ECP5/ECP5-5G devices have two clock dividers, one on the left side and one on the right side of the device. These are intended to generate a slower-speed system clock from a high-speed edge clock. The block operates in a $\div 2$, $\div 3.5$ mode and maintains a known phase relationship between the divided down clock and the high-speed clock based on the release of its reset signal.

The clock dividers can be fed from selected PLL outputs, external primary clock pins multiplexed with the DDRDEL Slave Delay or from routing. The clock divider outputs serve as primary clock sources and feed into the clock distribution network. The Reset (RST) control signal resets input and asynchronously forces all outputs to low. The SLIP signal slips the outputs one cycle relative to the input clock. For further information on clock dividers, refer to [ECP5 and ECP5-5G sysClock PLL/DLL Design and Usage Guide \(TN1263\)](#). Figure 2.9 shows the clock divider connections.

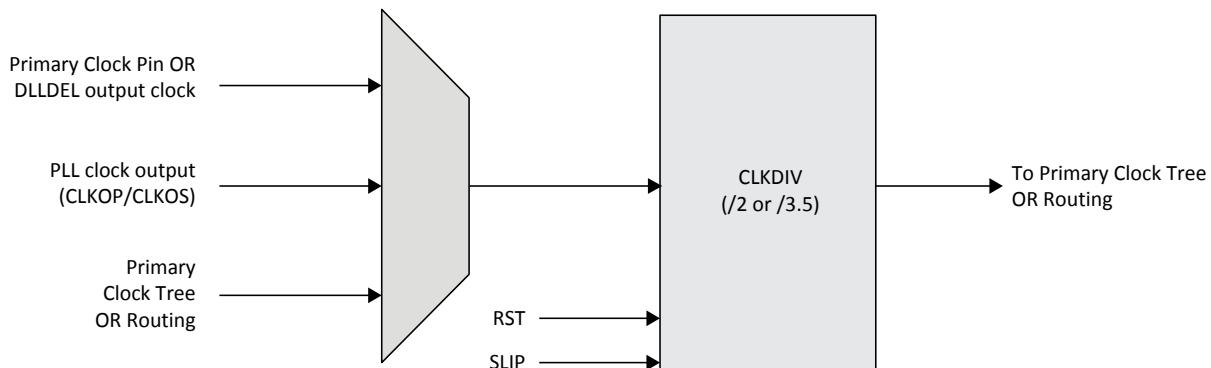

Figure 2.9. ECP5/ECP5-5G Clock Divider Sources

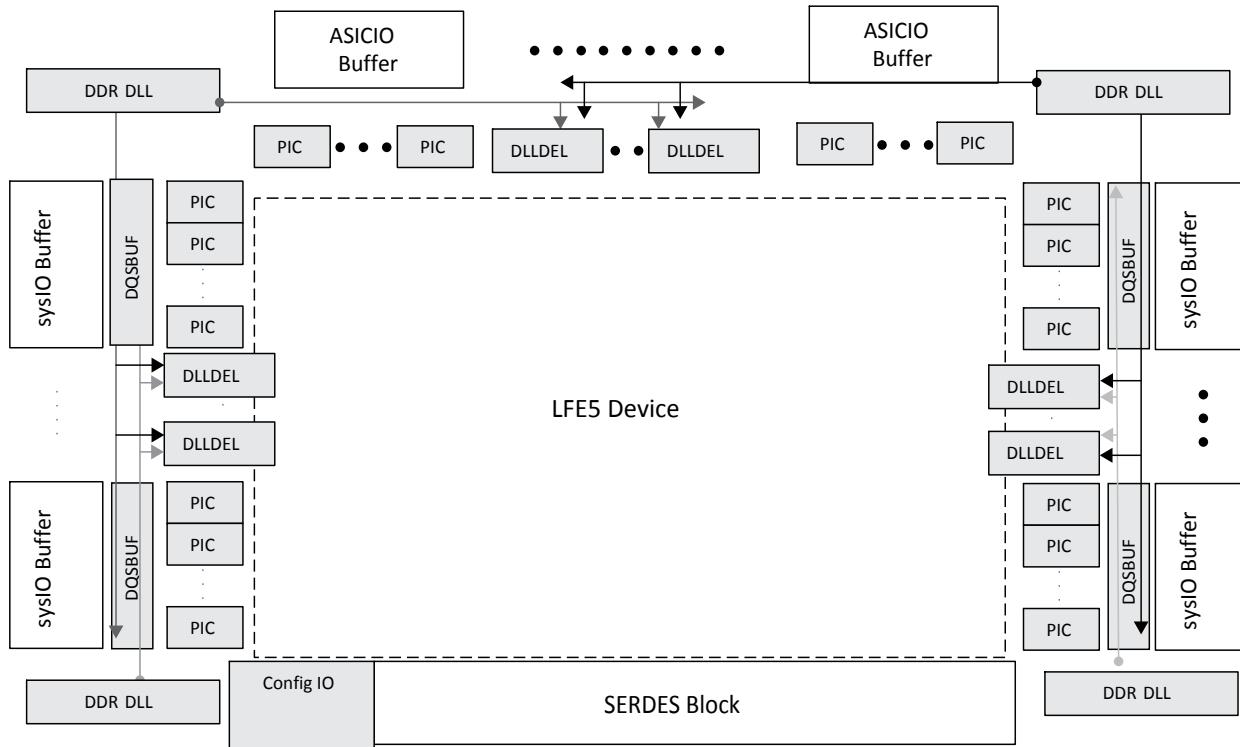

Figure 2.11. ECP5/ECP5-5G DLL Top Level View (For LFE-45 and LFE-85)

2.8. sysMEM Memory

ECP5/ECP5-5G devices contain a number of sysMEM Embedded Block RAM (EBR). The EBR consists of an 18 Kb RAM with memory core, dedicated input registers and output registers with separate clock and clock enable. Each EBR includes functionality to support true dual-port, pseudo dual-port, single-port RAM, ROM and FIFO buffers (via external PFUs).

2.8.1. sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as listed in [Table 2.6](#) on page 25. FIFOs can be implemented in sysMEM EBR blocks by implementing support logic with PFUs. The EBR block facilitates parity checking by supporting an optional parity bit for each data byte. EBR blocks provide byte-enable support for configurations with 18-bit and 36-bit data widths. For more information, refer to [ECP5 and ECP5-5G Memory Usage Guide \(TN1264\)](#).

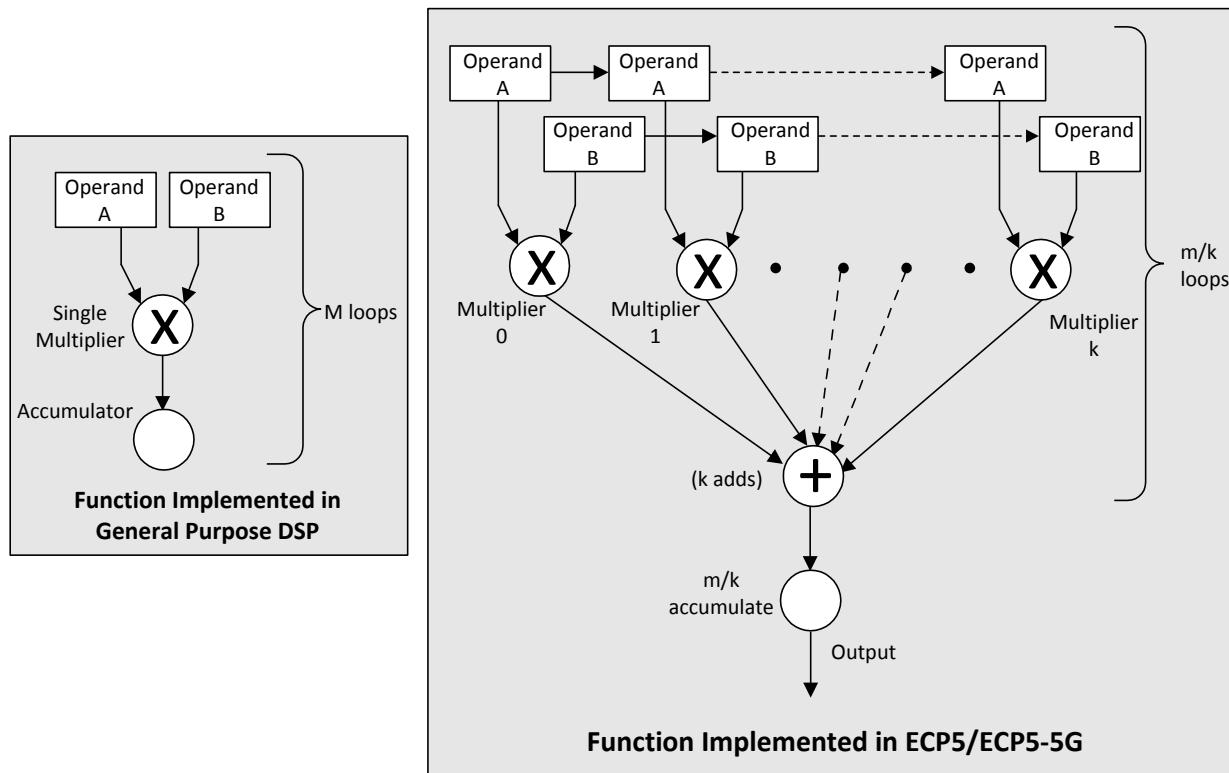

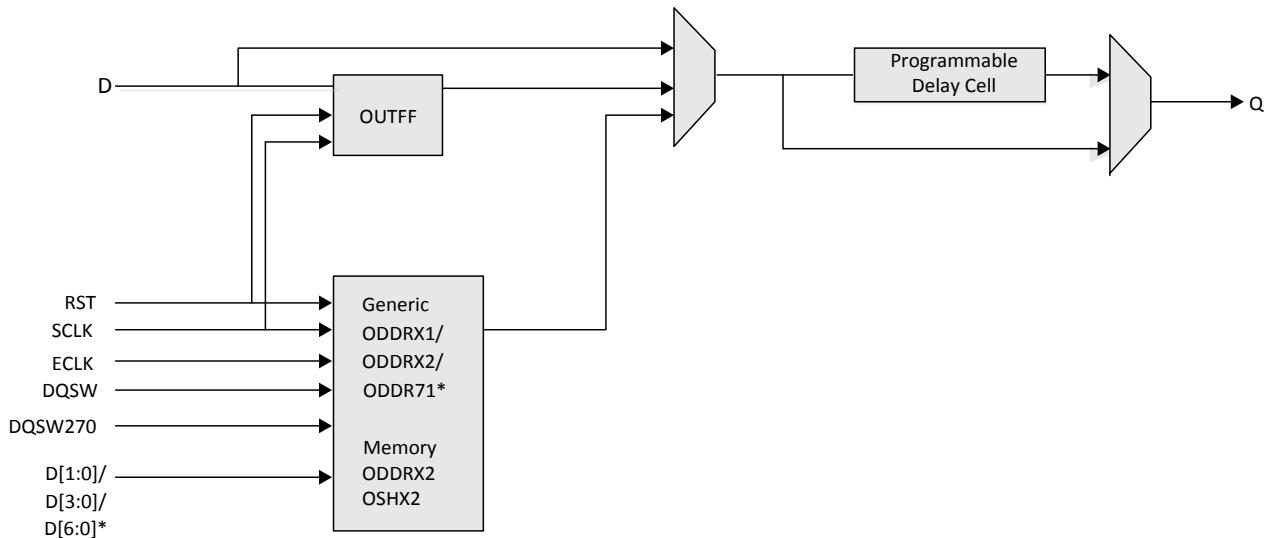

Figure 2.13. Comparison of General DSP and ECP5/ECP5-5G Approaches

2.9.2. sysDSP Slice Architecture Features

The ECP5/ECP5-5G sysDSP Slice has been significantly enhanced to provide functions needed for advanced processing applications. These enhancements provide improved flexibility and resource utilization.

The ECP5/ECP5-5G sysDSP Slice supports many functions that include the following:

- Symmetry support. The primary target application is wireless. 1D Symmetry is useful for many applications that use FIR filters when their coefficients have symmetry or asymmetry characteristics. The main motivation for using 1D symmetry is cost/size optimization. The expected size reduction is up to 2x.
 - Odd mode – Filter with Odd number of taps
 - Even mode – Filter with Even number of taps
 - Two dimensional (2D) symmetry mode – supports 2D filters for mainly video applications
- Dual-multiplier architecture. Lower accumulator overhead to half and the latency to half compared to single multiplier architecture
- Fully cascadable DSP across slices. Support for symmetric, asymmetric and non-symmetric filters.
- Multiply (one 18x36, two 18x18 or four 9x9 Multiplies per Slice)
- Multiply (36x36 by cascading across two sysDSP slices)
- Multiply Accumulate (supports one 18x36 multiplier result accumulation or two 18x18 multiplier result accumulation)
- Two Multiplies feeding one Accumulate per cycle for increased processing with lower latency (two 18x18 Multiplies feed into an accumulator that can accumulate up to 52 bits)
- Pipeline registers
- 1D Symmetry support. The coefficients of FIR filters have symmetry or negative symmetry characteristics.
 - Odd mode – Filter with Odd number of taps
 - Even mode – Filter with Even number of taps
- 2D Symmetry support. The coefficients of 2D FIR filters have symmetry or negative symmetry characteristics.
 - 3*3 and 3*5 – Internal DSP Slice support

*For 7:1 LVDS interface only. It is required to use PIO pair pins PIOA/B.

Figure 2.20. Output Register Block on Left and Right Sides

Table 2.9. Output Block Port Description

Name	Type	Description
Q	Output	High Speed Data Output
D	Input	Data from core to output SDR register
D[1:0]/D[3:0]/ D[6:0]	Input	Low Speed Data from device core to output DDR register
RST	Input	Reset to the Output Block
SCLK	Input	Slow Speed System Clock
ECLK	Input	High Speed Edge Clock
DQSW	Input	Clock from DQS control Block used to generate DDR memory DQS output
DQSW270	Input	Clock from DQS control Block used to generate DDR memory DQ output

2.12. Tristate Register Block

The tristate register block registers tristate control signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation. In SDR, TD input feeds one of the flip-flops that then feeds the output. In DDR operation used mainly for DDR memory interface can be implemented on the left and right sides of the device. Here two inputs feed the tristate registers clocked by both ECLK and SCLK.

Figure 2.21 and Figure 2.22 show the Tristate Register Block functions on the device. For detailed description of the tristate register block modes and usage, refer to [ECP5 and ECP5-5G High-Speed I/O Interface \(TN1265\)](#).

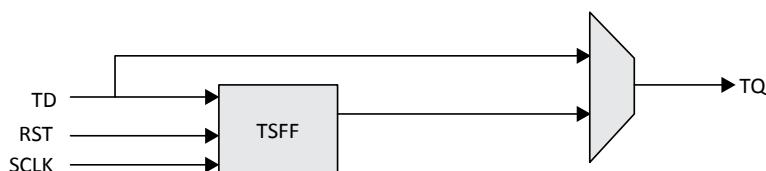

Figure 2.21. Tristate Register Block on Top Side

2.15. SERDES and Physical Coding Sublayer

LFE5UM/LFE5UM5G devices feature up to 4 channels of embedded SERDES/PCS arranged in dual-channel blocks at the bottom of the devices. Each channel supports up to 3.2 Gb/s (ECP5), or up to 5 Gb/s (ECP5-5G) data rate. [Figure 2.27](#) shows the position of the dual blocks for the LFE5-85. [Table 2.13](#) shows the location of available SERDES Duals for all devices. The LFE5UM/LFE5UM5G SERDES/PCS supports a range of popular serial protocols, including:

- PCI Express Gen1 and Gen2 (2.5 Gb/s) on ECP5UM; Gen 1, Gen2 (2.5 Gb/s and 5 Gb/s) on ECP5-5G
- Ethernet (XAUI, GbE – 1000 Base CS/SX/LX and SGMII)
- SMPTE SDI (3G-SDI, HD-SDI, SD-SDI)
- CPRI (E.6.LV: 614.4 Mb/s, E.12.LV: 1228.8 Mb/s, E.24.LV: 2457.6 Mb/s, E.30.LV: 3072 Mb/s), also E.48.LV2:4915 Mb/s in ECP5-5G
- JESD204A/B – ADC and DAC converter interface: 312.5 Mb/s to 3.125 Gb/s (ECP5) / 5 Gb/s (ECP5-5G)

Each dual contains two dedicated SERDES for high speed, full duplex serial data transfer. Each dual also has a PCS block that interfaces to the SERDES channels and contains protocol specific digital logic to support the standards listed above. The PCS block also contains interface logic to the FPGA fabric. All PCS logic for dedicated protocol support can also be bypassed to allow raw 8-bit or 10-bit interfaces to the FPGA fabric.

Even though the SERDES/PCS blocks are arranged in duals, multiple baud rates can be supported within a dual with the use of dedicated, per channel /1, /2 and /11 rate dividers. Additionally, two duals can be arranged together to form x4 channel link.

ECP5UM devices and ECP5-5G devices are pin-to-pin compatible. But, the ECP5UM devices require 1.1 V on VCCA, VCCHRX and VCCHTX supplies. ECP5-5G devices require 1.2 V on these supplies. When designing either family device with migration in mind, these supplies need to be connected such that it is possible to adjust the voltage level on these supplies.

When a SERDES Dual in a 2-Dual device is not used, the power VCCA power supply for that Dual should be connected. It is advised to connect the VCCA of unused channel to core if the user knows he will not use the Dual at all, or it should be connected to a different regulated supply, if that Dual may be used in the future.

For an unused channel in a Dual, it is advised to connect the VCCHTX to VCCA, and user can leave VCCHRX unconnected.

For information on how to use the SERDES/PCS blocks to support specific protocols, as well on how to combine multiple protocols and baud rates within a device, refer to [ECP5 and ECP5-5G SERDES/PCS Usage Guide \(TN1261\)](#).

3.3. Power Supply Ramp Rates

Table 3.3. Power Supply Ramp Rates

Symbol	Parameter	Min	Typ	Max	Unit
t_{RAMP}	Power Supply ramp rates for all supplies	0.01	—	10	V/ms

Note: Assumes monotonic ramp rates.

3.4. Power-On-Reset Voltage Levels

Table 3.4. Power-On-Reset Voltage Levels

Symbol	Parameter	Min	Typ	Max	Unit
V_{PORUP}	All Devices	V_{CC}	0.90	—	V
		V_{CCAUX}	2.00	—	V
		V_{CCIO8}	0.95	—	V
V_{PORDN}	All Devices	V_{CC}	0.77	—	V
		V_{CCAUX}	1.80	—	V

Notes:

- These POR trip points are only provided for guidance. Device operation is only characterized for power supply voltages specified under recommended operating conditions.
- Only V_{CCIO8} has a Power-On-Reset ramp up trip point. All other V_{CCIOs} do not have Power-On-Reset ramp up detection.
- V_{CCIO8} does not have a Power-On-Reset ramp down detection. V_{CCIO8} must remain within the Recommended Operating Conditions to ensure proper operation.

3.5. Power up Sequence

Power-On-Reset (POR) puts the ECP5/ECP5-5G device in a reset state. POR is released when V_{CC} , V_{CCAUX} , and V_{CCIO8} are ramped above the V_{PORUP} voltage, as specified above.

V_{CCIO8} controls the voltage on the configuration I/O pins. If the ECP5/ECP5-5G device is using Master SPI mode to download configuration data from external SPI Flash, it is required to ramp V_{CCIO8} above V_{IH} of the external SPI Flash, before at least one of the other two supplies (V_{CC} and/or V_{CCAUX}) is ramped to V_{PORUP} voltage level. If the system cannot meet this power up sequence requirement, and requires the V_{CCIO8} to be ramped last, then the system must keep either PROGRAMN or INITN pin LOW during power up, until V_{CCIO8} reaches V_{IH} of the external SPI Flash. This ensures the signals driven out on the configuration pins to the external SPI Flash meet the V_{IH} voltage requirement of the SPI Flash. For LFE5UM/LFE5UM5G devices, it is required to power up V_{CCA} , before V_{CCAUXA} is powered up.

3.6. Hot Socketing Specifications

Table 3.5. Hot Socketing Specifications

Symbol	Parameter	Condition	Min	Typ	Max	Unit
IDK_HS	Input or I/O Leakage Current for Top and Bottom Banks Only	$0 \leq V_{IN} \leq V_{IH}$ (Max)	—	—	± 1	mA
IDK	Input or I/O Leakage Current for Left and Right Banks Only	$0 \leq V_{IN} < V_{CCIO}$	—	—	± 1	mA
		$V_{CCIO} \leq V_{IN} \leq V_{CCIO} + 0.5$ V	—	18	—	mA

Notes:

1. V_{CC} , V_{CCAUX} and V_{CCIO} should rise/fall monotonically.
2. I_{DK} is additive to I_{PU} , I_{PW} or I_{BH} .
3. LVCMOS and LVTTL only.
4. Hot socket specification defines when the hot socketed device's junction temperature is at 85 °C or below. When the hot socketed device's junction temperature is above 85 °C, the I_{DK} current can exceed ± 1 mA.

3.14.8. SLVS

Scalable Low-Voltage Signaling (SLVS) is based on a point-to-point signaling method defined in the JEDEC JESD8-13 (SLVS-400) standard. This standard evolved from the traditional LVDS standard and relies on the advantage of its use of smaller voltage swings and a lower common-mode voltage. The 200 mV (400 mV p-p) SLVS swing contributes to a reduction in power.

The ECP5/ECP5-5G devices can receive differential input up to 800 Mb/s with its LVDS input buffer. This LVDS input buffer is used to meet the SLVS input standard specified by the JEDEC standard. The SLVS output parameters are compared to ECP5/ECP5-5G LVDS input parameters, as listed in Table 3.18.

Table 3.18. Input to SLVS

Parameter	ECP5/ECP5-5G LVDS Input	SLVS Output	Unit
Vcm (min)	50	150	mV
Vcm (max)	2350	250	mV
Differential Voltage (min)	100	140	mV
Differential Voltage (max)	—	270	mV

ECP5/ECP5-5G does not support SLVS output. However, SLVS output can be created using ECP5/ECP5-5G LVDS outputs by level shift to meet the low Vcm/Vod levels required by SLVS. [Figure 3.5](#) shows how the LVDS output can be shifted external to meet SLVS levels.

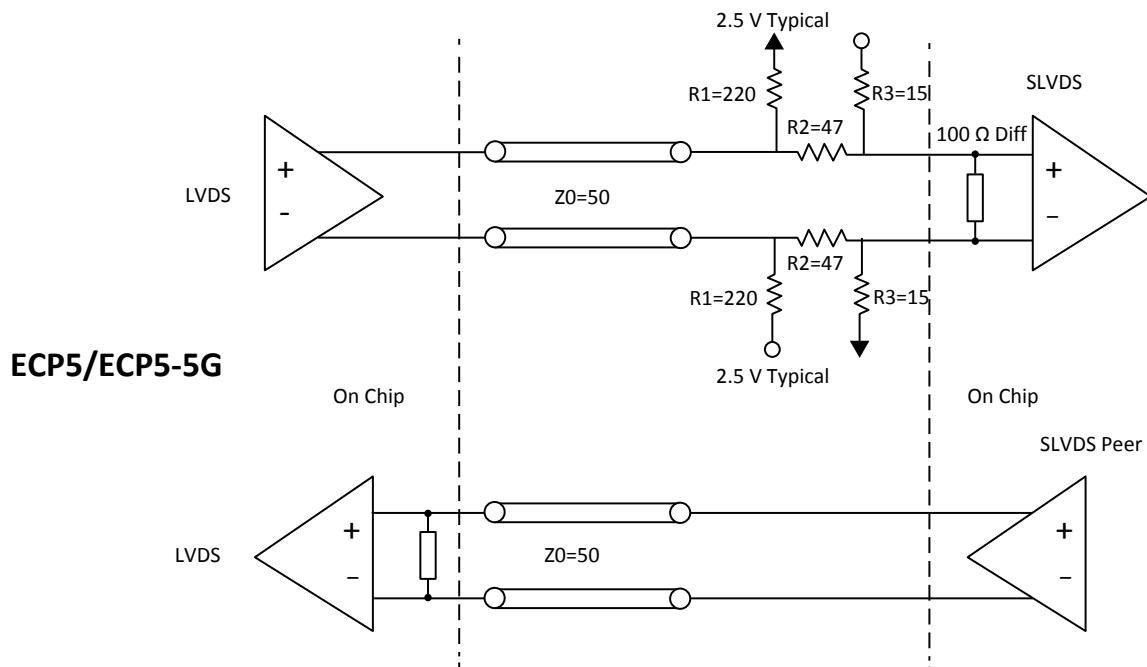

Figure 3.5. SLVS Interface

Table 3.20. Register-to-Register Performance

Function	-8 Timing	Unit
Basic Functions		
16-Bit Decoder	441	MHz
32-Bit Decoder	441	MHz

16 x 4 Pseudo-Dual Port (Two PFUs)	441	MHz
DSP Functions		
9 x 9 Multiplier (All Registers)	225	MHz
18 x 18 Multiplier (All Registers)	225	MHz
36 x 36 Multiplier (All Registers)	225	MHz
18 x 18 Multiply-Add/Sub (All Registers)	225	MHz
18 x 18 Multiply/Accumulate (Input and Output Registers)	225	MHz

Notes:

- These functions were generated using Lattice Diamond design software tool. Exact performance may vary with the device and the design software tool version. The design software tool uses internal parameters that have been characterized but are not tested on every device.
- Commercial timing numbers are shown. Industrial numbers are typically slower and can be extracted from Lattice Diamond design software tool.

3.16. Derating Timing Tables

Logic timing provided in the following sections of this data sheet and the Diamond design tools are worst case numbers in the operating range. Actual delays at nominal temperature and voltage for best case process, can be much better than the values given in the tables. The Diamond design tool can provide logic timing numbers at a particular temperature and voltage.

3.18. External Switching Characteristics

Over recommended commercial operating conditions.

Table 3.22. ECP5/ECP5-5G External Switching Characteristics

Parameter	Description	Device	-8		-7		-6		Unit			
			Min	Max	Min	Max	Min	Max

General I/O Pin Parameters Using Dedicated Primary Clock Input without PLL												
t _{CO}	Clock to Output - PIO Output Register	All Devices	—	5.4	—	6.1	—	6.8	ns			
t _{SU}	Clock to Data Setup - PIO Input Register	All Devices	0	—	0	—	0	—	ns			
t _H	Clock to Data Hold - PIO Input Register	All Devices	2.7	—	3	—	3.3	—	ns			
t _{SU_DEL}	Clock to Data Setup - PIO Input Register with Data Input Delay	All Devices	1.2	—	1.33	—	1.46	—	ns			
t _{H_DEL}	Clock to Data Hold - PIO Input Register with Data Input Delay	All Devices	0	—	0	—	0	—	ns			
f _{MAX_IO}	Clock Frequency of I/O and PFU Register	All Devices	—	400	—	350	—	312	MHz			
General I/O Pin Parameters Using Dedicated Primary Clock Input with PLL												
t _{COPLL}	Clock to Output - PIO Output Register	All Devices	—	3.5	—	3.8	—	4.1	ns			
t _{SUPPLL}	Clock to Data Setup - PIO Input Register	All Devices	0.7	—	0.78	—	0.85	—	ns			
t _{HPLL}	Clock to Data Hold - PIO Input Register	All Devices	0.8	—	0.89	—	0.98	—	ns			
t _{SU_DELPLL}	Clock to Data Setup - PIO Input Register with Data Input Delay	All Devices	1.6	—	1.78	—	1.95	—	ns			

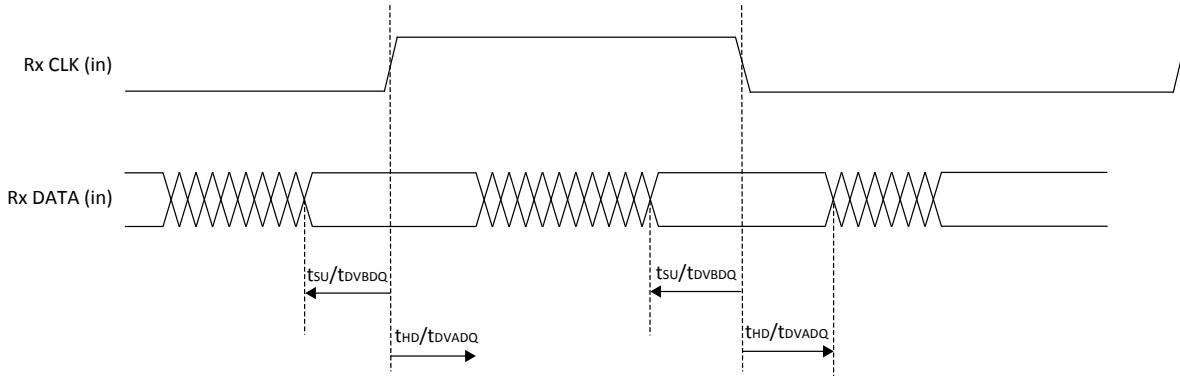

Figure 3.6. Receiver RX.CLK.Centered Waveforms

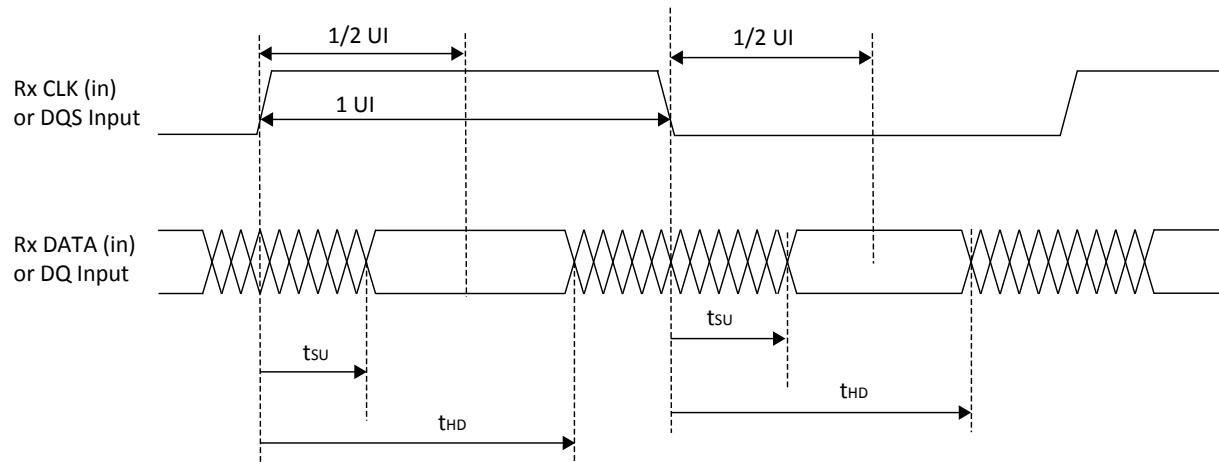

Figure 3.7. Receiver RX.CLK.Aligned and DDR Memory Input Waveforms

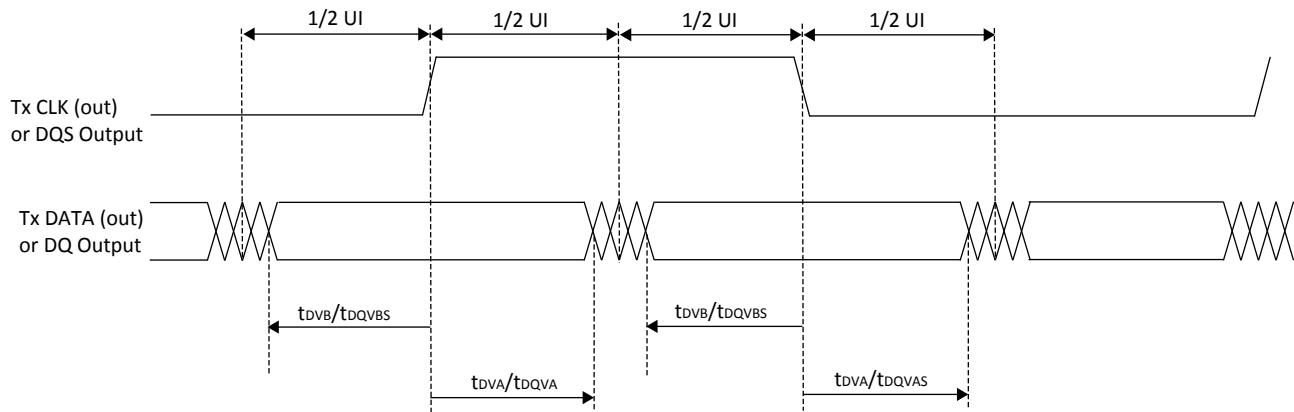

Figure 3.8. Transmit TX.CLK.Centered and DDR Memory Output Waveforms

3.27. XAUI/CPRI LV E.30 Electrical and Timing Characteristics

3.27.1. AC and DC Characteristics

Over recommended operating conditions.

Table 3.33. Transmit

Symbol	Description	Test Conditions	Min	Typ	Max	Unit
T _{RF}	Differential rise/fall time	20% to 80%	—	80	—	ps
Z _{TX_DIFF_DC}	Differential impedance	—	80	100	120	Ω
J _{TX_DDJ} ^{2, 3}	Output data deterministic jitter	—	—	—	0.17	UI
J _{TX_TJ} ^{1, 2, 3}	Total output data jitter	—	—	—	0.35	UI

Notes:

1. Total jitter includes both deterministic jitter and random jitter.
2. Jitter values are measured with each CML output AC coupled into a 50 Ω impedance (100 Ω differential impedance).
3. Jitter and skew are specified between differential crossings of the 50% threshold of the reference signal.

Over recommended operating conditions.

Table 3.34. Receive and Jitter Tolerance

Symbol	Description	Test Conditions	Min	Typ	Max	Unit
RL _{RX_DIFF}	Differential return loss	From 100 MHz to 3.125 GHz	10	—	—	dB
RL _{RX_CM}	Common mode return loss	From 100 MHz to 3.125 GHz	6	—	—	dB
Z _{RX_DIFF}	Differential termination resistance	—	80	100	120	Ω
J _{RX_DJ} ^{1, 2, 3}	Deterministic jitter tolerance (peak-to-peak)	—	—	—	0.37	UI
J _{RX_RJ} ^{1, 2, 3}	Random jitter tolerance (peak-to-peak)	—	—	—	0.18	UI
J _{RX_SJ} ^{1, 2, 3}	Sinusoidal jitter tolerance (peak-to-peak)	—	—	—	0.10	UI
J _{RX_TJ} ^{1, 2, 3}	Total jitter tolerance (peak-to-peak)	—	—	—	0.65	UI
T _{RX_EYE}	Receiver eye opening	—	0.35	—	—	UI

Notes:

1. Total jitter includes deterministic jitter, random jitter and sinusoidal jitter.
2. Jitter values are measured with each high-speed input AC coupled into a 50 Ω impedance.
3. Jitter and skew are specified between differential crossings of the 50% threshold of the reference signal.

3.28. CPRI LV E.24/SGMII(2.5Gbps) Electrical and Timing Characteristics

3.28.1. AC and DC Characteristics

Table 3.35. Transmit

Symbol	Description	Test Conditions	Min	Typ	Max	Unit
T _{RF} ¹	Differential rise/fall time	20% to 80%	—	80	—	ps
Z _{TX_DIFF_DC}	Differential impedance	—	80	100	120	Ω
J _{TX_DDJ} ^{3, 4}	Output data deterministic jitter	—	—	—	0.17	UI
J _{TX_TJ} ^{2, 4}	Total output data jitter	—	—	—	0.35	UI

Notes:

1. Rise and Fall times measured with board trace, connector and approximately 2.5 pf load.
2. Total jitter includes both deterministic jitter and random jitter. The random jitter is the total jitter minus the actual deterministic jitter.
3. Jitter values are measured with each CML output AC coupled into a 50 Ω impedance (100 Ω differential impedance).
4. Jitter and skew are specified between differential crossings of the 50% threshold of the reference signal.

3.31. sysCONFIG Port Timing Specifications

Over recommended operating conditions.

Table 3.42. ECP5/ECP5-5G sysCONFIG Port Timing Specifications

Symbol	Parameter		Min	Max	Unit
POR, Configuration Initialization, and Wakeup					
t_{ICFG}	Time from the Application of V_{CC} , V_{CCAUX} or V_{CCIO8} (whichever is the last) to the rising edge of INITN	—	—	33	ms
t_{VMC}	Time from t_{ICFG} to the valid Master CCLK	—	—	5	us
t_{cz}	CCLK from Active to High-Z	—	—	300	ns
Master CCLK					
f_{MCLK}	Frequency	All selected frequencies	-20	20	%
$t_{MCLK-DC}$	Duty Cycle	All selected frequencies	40	60	%
All Configuration Modes					
t_{PRGM}	PROGRAMN LOW pulse accepted	—	110	—	ns
t_{PRGMRJ}	PROGRAMN LOW pulse rejected	—	—	50	ns
t_{INITL}	INITN LOW time	—	—	55	ns
t_{DPPINT}	PROGRAMN LOW to INITN LOW	—	—	70	ns
$t_{DPPDONE}$	PROGRAMN LOW to DONE LOW	—	—	80	ns
t_{IODISS}	PROGRAMN LOW to I/O Disabled	—	—	150	ns
Slave SPI					
f_{CCLK}	CCLK input clock frequency	—	—	60	MHz
t_{CCLKH}	CCLK input clock pulselength HIGH	—	6	—	ns
t_{CCLKL}	CCLK input clock pulselength LOW	—	6	—	ns
t_{STSU}	CCLK setup time	—	1	—	ns
t_{STH}	CCLK hold time	—	1	—	ns
t_{STCO}	CCLK falling edge to valid output	—	—	10	ns
t_{STOZ}	CCLK falling edge to valid disable	—	—	10	ns
t_{STOV}	CCLK falling edge to valid enable	—	—	10	ns
t_{SCS}	Chip Select HIGH time	—	25	—	ns
t_{SCSS}	Chip Select setup time	—	3	—	ns
t_{SCSH}	Chip Select hold time	—	3	—	ns
Master SPI					
f_{CCLK}	Max selected CCLK output frequency	—	—	62	MHz
t_{CCLKH}	CCLK output clock pulse width HIGH	—	3.5	—	ns
t_{CCLKL}	CCLK output clock pulse width LOW	—	3.5	—	ns
t_{STSU}	CCLK setup time	—	5	—	ns
t_{STH}	CCLK hold time	—	1	—	ns
t_{CSSPI}	INITN HIGH to Chip Select LOW	—	100	200	ns
t_{CFGX}	INITN HIGH to first CCLK edge	—	—	150	ns
Slave Serial					
f_{CCLK}	CCLK input clock frequency	—	—	66	MHz
t_{SSCH}	CCLK input clock pulse width HIGH	—	5	—	ns
t_{SSCL}	CCLK input clock pulse width LOW	—	5	—	ns
t_{SUSCDI}	CCLK setup time	—	0.5	—	ns
t_{HSCDI}	CCLK hold time	—	1.5	—	ns

Signal Name	I/O	Description
Configuration Pads (Used during sysCONFIG) (Continued)		
D1/MISO/IO1	I/O	Parallel configuration I/O. Open drain during configuration. When in SPI modes, it is an input in Master mode, and output in Slave mode. This is a shared I/O pin. When not in configuration, it can be used as general purpose I/O pin.
D2/IO2	I/O	Parallel configuration I/O. Open drain during configuration. This is a shared I/O pin. When not in configuration, it can be used as general purpose I/O pin.
D3/IO3	I/O	Parallel configuration I/O. Open drain during configuration. This is a shared I/O pin. When not in configuration, it can be used as general purpose I/O pin.
D4/IO4	I/O	Parallel configuration I/O. Open drain during configuration. This is a shared I/O pin. When not in configuration, it can be used as general purpose I/O pin.
D5/IO5	I/O	Parallel configuration I/O. Open drain during configuration. This is a shared I/O pin. When not in configuration, it can be used as general purpose I/O pin.
D6/IO6	I/O	Parallel configuration I/O. Open drain during configuration. When in SPI modes, it is an output in Master mode, and input in Slave mode. This is a shared I/O pin. When not in configuration, it can be used as general purpose I/O pin.
D7/IO7	I/O	Parallel configuration I/O. Open drain during configuration. When in SPI modes, it is an output in Master mode, and input in Slave mode. This is a shared I/O pin. When not in configuration, it can be used as general purpose I/O pin
SERDES Function		
VCCA _x	—	SERDES, transmit, receive, PLL and reference clock buffer power supply for SERDES Dual x. All VCCA supply pins must always be powered to the recommended operating voltage range. If no SERDES channels are used, connect VCCA to VCC. VCCA _x = 1.1 V for ECP5, VCCA _x = 1.2 V for ECP5-5G.
VCCAUXA _x	—	SERDES Aux Power Supply pin for SERDES Dual x. VCCAUXA _x = 2.5 V.
HDRX[P/N]_D[dual_num]CH[chan_num]	I	High-speed SERDES inputs, P = Positive, N = Negative, dual_num = [0, 1], chan_num = [0, 1]. These are dedicated SERDES input pins.
HDTX[P/N]_D[dual_num]CH[chan_num]	O	High-speed SERDES outputs, P = Positive, N = Negative, dual_num = [0, 1], chan_num = [0, 1]. These are dedicated SERDES output pins.
REFCLK[P/N]_D[dual_num]	I	SERDES Reference Clock inputs, P = Positive, N = Negative, dual_num = [0, 1]. These are dedicated SERDES input pins.
VCCHRX_D[dual_num]CH[chan_num]	—	SERDES High-Speed Inputs Termination Voltage Supplies, dual_num = [0, 1], chan_num = [0, 1]. These pins should be powered to 1.1 V on ECP5, or 1.2 V on ECP5-5G.
VCCHTX_D[dual_num]CH[chan_num]	—	SERDES High-Speed Outputs Buffer Voltage Supplies, dual_num = [0, 1], chan_num = [0, 1]. These pins should be powered to 1.1 V on ECP5, or 1.2 V on ECP5-5G.

Notes:

- When placing switching I/Os around these critical pins that are designed to supply the device with the proper reference or supply voltage, care must be given.
- These pins are dedicated inputs or can be used as general purpose I/O.
- m defines the associated channel in the quad.

(Continued)

Date	Version	Section	Change Summary
November 2015	1.5	All	<p>Added ECP5-5G device family.</p> <p>Changed document title to ECP5 and ECP5-5G Family Data Sheet.</p>
		General Description	Updated Features section. Added support for eDP in RDR and HDR.
	1.4	Architecture	<p>Updated Overview section.</p> <p>Revised Figure 2.1. Simplified Block Diagram, LFE5UM/LFE5UM5G-85 Device (Top Level). Modified Flexible sysIO description and Note.</p>
			<p>Updated SERDES and Physical Coding Sublayer section.</p> <ul style="list-style-type: none"> • Changed E.24.V in CPRI protocol to E.24.LV. • Removed “1.1 V” from paragraph on unused Dual.
		DC and Switching Characteristics	<p>Updated Hot Socketing Requirements section. Revised V_{CCHTX} in table notes 1 and 3. Indicated V_{CCHTX} in table note 4.</p> <p>Updated SERDES High-Speed Data Transmitter section. Revised V_{CCHTX} in table note 1.</p>
		Ordering Information	Updated ECP5/ECP5-5G Part Number Description section. Changed “LFE5 FPGA” under Device Family to “ECP5 FPGA”.
		General Description	<p>Updated Features section.</p> <ul style="list-style-type: none"> • Removed SMPTE3G under Embedded SERDES. • Added Single Event Upset (SEU) Mitigation Support. <p>Removed SMPTE protocol in fifth paragraph.</p>
	1.3	Architecture	General update.
		DC and Switching Characteristics	General update.
		Pinout Information	<p>Updated Signal Descriptions section. Revised the descriptions of the following signals:</p> <ul style="list-style-type: none"> • $P[L/R][Group\ Number]_[A/B/C/D]$ • $P[T/B][Group\ Number]_[A/B]$ • D4/IO4 (Previously named D4/MOSI2/IO4) • D5/IO5 (Previously named D5/MISO/IO5) • $VCCHRX_D[dual_num]CH[chan_num]$ • $VCCHTX_D[dual_num]CH[chan_num]$
		Supplemental Information	Added TN1184 reference.
