

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

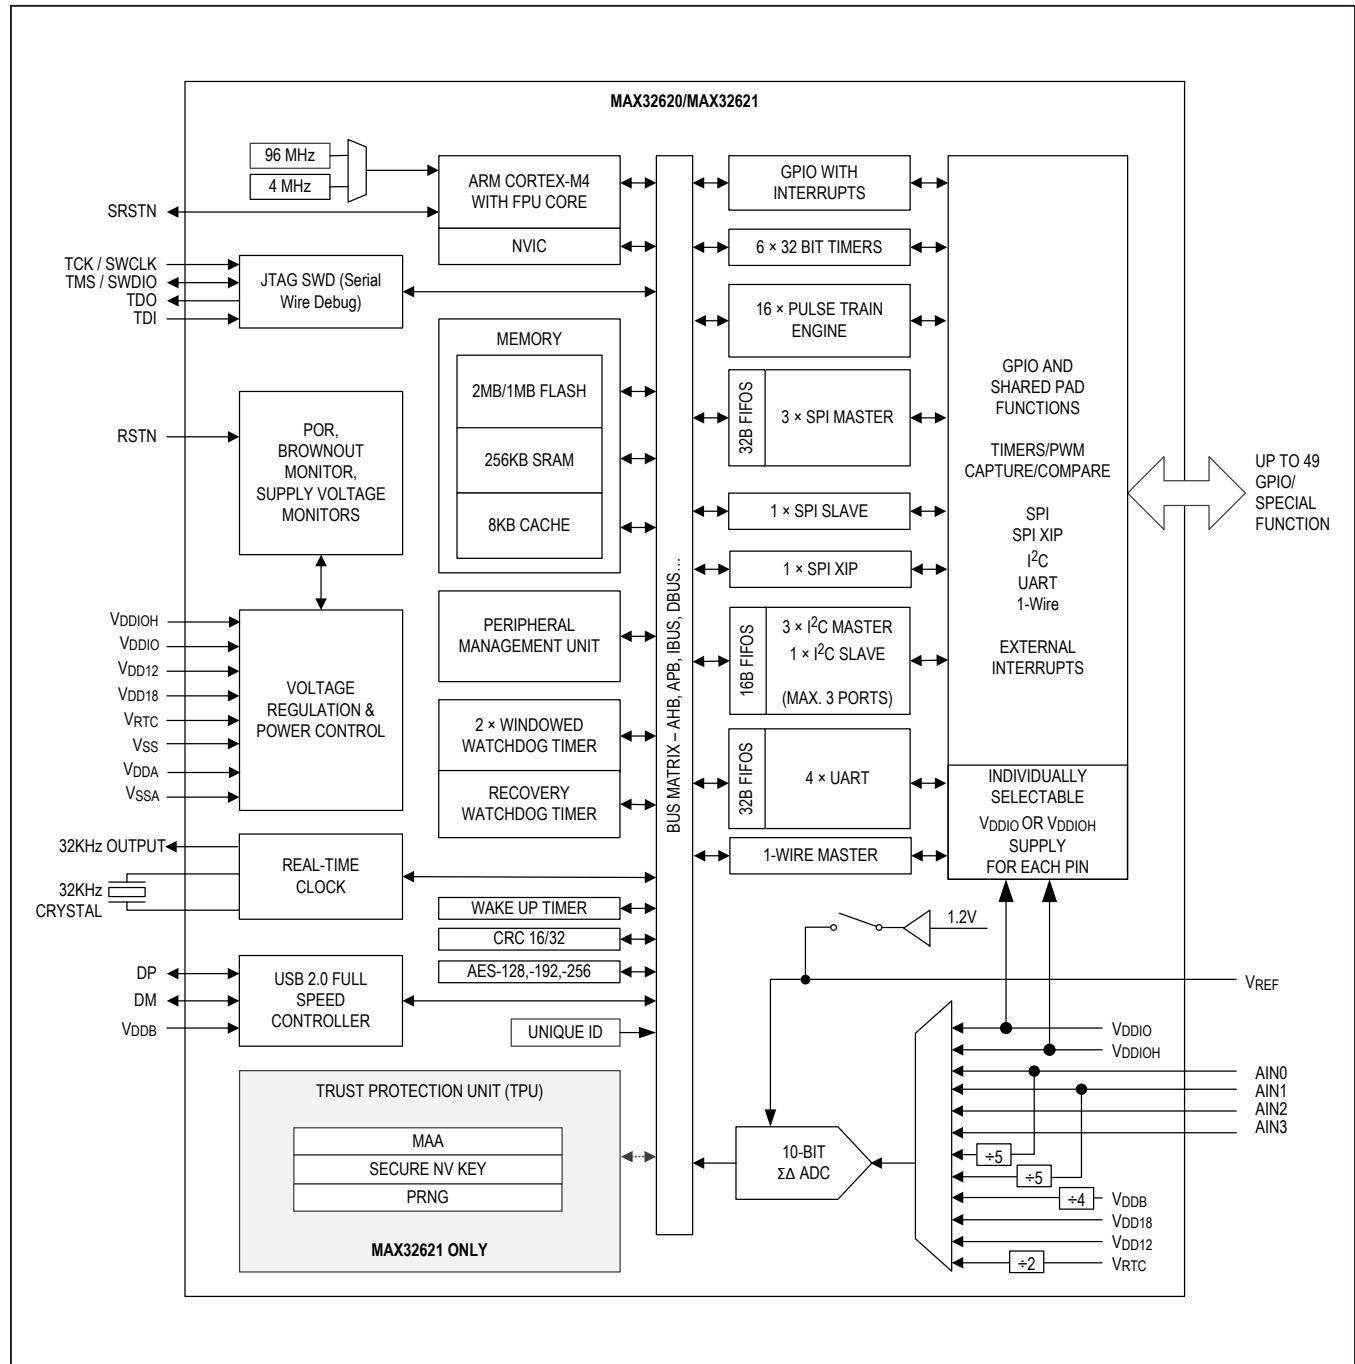

Details

Product Status	Active
Core Processor	ARM® Cortex®-M4F
Core Size	32-Bit Single-Core
Speed	96MHz
Connectivity	1-Wire, I ² C, SPI, UART/USART, USB
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	49
Program Memory Size	2MB (2M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256K x 8
Voltage - Supply (Vcc/Vdd)	1.14V ~ 3.6V
Data Converters	A/D 4x10b
Oscillator Type	Internal
Operating Temperature	-30°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	81-WFBGA, WLBGA
Supplier Device Package	81-WLP (3.95x4.11)
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/max32620iwg

MAX32620/MAX32621

High-Performance, Ultra-Low Power ARM Cortex-M4 with FPU-Based Microcontroller for Rechargeable Devices

MAX32620/MAX32621 Block Diagram

Absolute Maximum Ratings

(All voltages with respect to V_{SS} , unless otherwise noted.)

V_{DD18}-0.3V to +1.89V	V_{DDIOH}-0.3V to +3.6V
V_{DD12}-0.3V to +1.26V	Total current V_{DD18} , $V_{DDIO}(\text{sink})$100mA
V_{DDA} with respect to V_{SSA}-0.3V to +1.89V	Total current V_{SS}100mA
V_{RTC}-0.3V to +1.89V	Output current (sink) by Any I/O pin25mA
V_{DDB}-0.3V to +3.6V	Output current (source) by Any I/O pin-25mA
V_{REF}-0.3V to +3.6V	Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)	
32KIN, 32KOUT-0.3V to +3.6V	TQFP (multilayer board)	
RSTN, SRSTN, GPIO, DP, DM, JTAG-0.3V to +3.6V	(derate 45.5mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)3636.4mW
AIN[1:0]-0.3V to +5.5V	Operating Temperature Range -30°C to $+85^\circ\text{C}$
AIN[3:2]-0.3V to +3.6V	Storage Temperature Range -65°C to $+150^\circ\text{C}$
V_{DDIO}-0.3V to +3.6V	Soldering Temperature (reflow) $+260^\circ\text{C}$

This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

Package Thermal Characteristics (Note 1)

TQFP

Junction-to-Ambient Thermal Resistance (θ_{JA})22 $^\circ\text{C}/\text{W}$

Junction-to-Case Thermal Resistance (θ_{JC})2 $^\circ\text{C}/\text{W}$

WLP

Junction-to-Ambient Thermal Resistance (θ_{JA})36 $^\circ\text{C}/\text{W}$

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Electrical Characteristics

(Limits are tested at $T_A = +25^\circ\text{C}$ and $T_A = +85^\circ\text{C}$. Limits over the operating temperature range and relevant supply voltage range are guaranteed by design and characterization. Specifications marked GBD are guaranteed by design and not production tested.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Voltage	V_{DD18}		1.71	1.8	1.89	V
	V_{DD12}		1.14	1.2	1.26	
	V_{DDA}		1.71	1.8	1.89	
	V_{RTC}		1.71	1.8	1.89	
	V_{DDB}		3.04	3.3	3.60	
	V_{DDIO}		1.71	1.8	3.60	
	V_{DDIOH}	V_{DDIOH} must be $\geq V_{DDIO}$	1.71	1.8	3.60	
Power-Fail Reset Voltage	V_{RST}	Monitors V_{DD18}	1.1		1.70	V
Power On Reset Voltage	V_{POR}	Monitors V_{DD18}		1.5		V
RAM Data Retention Voltage	V_{DRV}	V_{DD12} supply, retention in LP1		0.93		V
V_{DD12} Dynamic Current, LP3 Mode	I_{DD12_DLP3}	Measured on the V_{DD12} pin and executing code from cache memory, all inputs are tied to V_{SS} or V_{DDIO} , outputs do not source/sink any current, PMU disabled		102		$\mu\text{A}/\text{MHz}$

Electrical Characteristics (continued)

(Limits are tested at $T_A = +25^\circ\text{C}$ and $T_A = +85^\circ\text{C}$. Limits over the operating temperature range and relevant supply voltage range are guaranteed by design and characterization. Specifications marked GBD are guaranteed by design and not production tested.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
V_{DD12} Current, LP3 Mode	I_{DD12_LP3}	96MHz oscillator selected as system clock, measured on the V_{DD12} pin and executing code from cache memory, all inputs are tied to V_{SS} or V_{DDIO} , outputs do not source/sink any current		96		μA
		4MHz oscillator selected as system clock measured on the V_{DD12} pin and executing code from cache memory, all inputs are tied to V_{SS} or V_{DDIO} , outputs do not source/sink any current		49		
V_{DD18} Current, LP3 Mode	I_{DD18_LP3}	96MHz oscillator selected as system clock, measured on the V_{DD18} pin and executing code from cache memory, all inputs are tied to V_{SS} or V_{DDIO} , outputs do not source/sink any current		366		μA
		4MHz oscillator selected as system clock, measured on the V_{DD18} pin and executing code from cache memory, all inputs are tied to V_{SS} or V_{DDIO} , outputs do not source/sink any current.		33		
V_{RTC} Current, LP3 Mode	I_{RTC_LP3}	RTC disabled		1.15		μA
		RTC enabled		1.55		μA
V_{DD12} Dynamic Current, LP2 Mode	I_{DD12_DLP2}	Measured on the V_{DD12} pin, ARM in sleep mode, PMU with two channels active		23		$\mu\text{A}/\text{MHz}$
V_{DD12} Current, LP2 Mode	I_{DD12_LP2}	96MHz oscillator selected as system clock, measured on the V_{DD12} pin, ARM in sleep mode, system clock stopped		96		μA
		4MHz oscillator selected as system clock, measured on the V_{DD12} pin, ARM in sleep mode, system clock stopped		49		
V_{DD18} Current, LP2 Mode	I_{DD18_LP2}	96MHz oscillator selected as system clock, ARM in sleep mode, PMU with two channels active, all inputs are tied to V_{SS} or V_{DDIO} , outputs do not source/sink any current		366		μA
		4MHz oscillator selected as system clock, ARM in sleep mode, PMU with two channels active, all inputs are tied to V_{SS} or V_{DDIO} , outputs do not source/sink any current		33		
V_{RTC} Current, LP2 Mode	I_{RTC_LP2}	RTC disabled		1.15		μA
		RTC enabled		1.55		μA

Electrical Characteristics (continued)

		$\text{AIN}[3:0]$, $\text{ADC_CHSEL} = 0-3$, $\text{BUF_BYPASS} = 0$	50mV		$V_{\text{DDA}} - 50\text{mV}$	
		$\text{AIN}[1:0]$, $\text{ADC_CHSEL} = 4-5$, $\text{BUF_BYPASS} = 0$	50mV		5.5V	

ADC Electrical Characteristics (continued)

(Limits are tested at $T_A = +25^{\circ}\text{C}$ and $T_A = +85^{\circ}\text{C}$. Limits over the operating temperature range and relevant supply voltage range are guaranteed by design and characterization. Specifications marked GBD are guaranteed by design and not production tested.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Input Impedance	R_{AIN}	AIN[1:0], ADC_HSEL = 4–5, ADC active		45		k Ω
Input Dynamic Current, Switched Capacitance	I_{AIN}	ADC active, ADC buffer bypassed		4.5		μA
		ADC active, ADC buffer enabled		50		nA
Analog Input Capacitance	C_{AIN}	Fixed capacitance to ground		1		pF
		Dynamically switched capacitance		250		nF
Integral Nonlinearity	INL				± 2	LSb
Differential Nonlinearity	DNL				± 1	LSb
Offset Error	V_{OS}			± 1		LSb
Gain Error	GE			± 2		LSb
ADC Active Current	I_{ADC}	ADC active, reference buffer enabled, input buffer disabled		240		μA
Input Buffer Active Current	I_{INBUF}			53		μA
ADC Setup Time	t_{ADC_SU}	Any power-up of: ADC clock, ADC bias, reference buffer, or input buffer to CpuAdcStart			10	μs
		Any power-up of: ADC clock or ADC bias to CpuAdcStart			48	t_{CLK}
ADC Output Latency	t_{ADC}			1025		t_{CLK}
ADC Sample Rate	f_{ADC}				7.80	ksps
ADC Input Leakage	I_{ADC_LEAK}	AIN0 or AIN1, ADC inactive or channel not selected		0.12	4	nA
		AIN2 or AIN3, ADC inactive or channel not selected		0.02	1.0	nA
AIN0/AIN1 Resistor Divider Error		ADC_CHSEL = 4 or 5, not including ADC offset/gain error		± 2		LSb
Full-Scale Voltage	V_{FS}	ADC code = 0x3FF		1.20		V
Signal to Noise Ratio	SNR			58.5		dB
Signal to Noise and Distortion	SINAD			58.5		dB
Total Harmonic Distortion	THD			-68.5		dB
Spurious Free Dynamic Range	SFDR			74		dB
Bandgap Temperature Coefficient	V_{TEMPCO}	Box method		30		ppm/ $^{\circ}\text{C}$
Reference Input Capacitance	C_{REF_IN}	Dynamically switched capacitance, ADC_XREF=1, ADC active		250		fF
External Reference Voltage	V_{REF_EXT}	ADC_XREF = 1	1.17	1.23	1.29	V
Reference Dynamic Current	I_{REF_EXT}	ADC_XREF=1, ADC active		4.1		μA

Electrical Characteristics—SPI Slave

(Timing specifications are guaranteed by design and are not production tested.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Slave Operating Frequency, Write	$f_{\text{SCK_W}}$	Standard SPI mode			48	MHz
		Fast SPI mode			48	
Slave Operating Frequency	$f_{\text{SCK_R}}$	Standard SPI mode			22.7	MHz
		Fast SPI mode			45.5	
SCLK Period	t_{SCK}			$1/f_{\text{SCK}}$		ns

Electrical Characteristics—I²C Bus(Limits are 100% tested at $T_A = +25^\circ\text{C}$ and $T_A = +85^\circ\text{C}$. Limits over the operating temperature range and relevant supply voltage range are guaranteed by design and characterization. Specifications marked "GBD" are guaranteed by design and not production tested.)

MAX32620/MAX32621

High-Performance, Ultra-Low Power ARM
Cortex-M4 with FPU-Based Microcontroller
for Rechargeable Devices

Pin Configuration

Pin Configuration (continued)

Pin Description

PIN		NAME	FUNCTION
TQFP	WLP		
POWER			
61	D8	V _{DDB}	USB Transceiver Supply Voltage. This pin must be bypassed to V _{SS} with a 1.0μF capacitor as close as possible to this pin.
8	F1	V _{DD12}	1.2V Supply Voltage. This pin must be bypassed to V _{SS} with a 1.0μF capacitor as close as possible to this pin.
59	C8	V _{RTC}	RTC Supply Voltage. This pin must be bypassed to V _{SS} with a 1.0μF capacitor as close as possible to this pin.
29	B3	V _{DDA}	Analog Supply Voltage. This pin must be bypassed to V _{SSA} with a 1.0μF capacitor as close as possible to this pin.
91	J4	V _{DD18}	1.8V Supply Voltage. This pin must be bypassed to V _{SS} with a 1.0μF capacitor as close as possible to this pin.
2, 63	E9, H1	V _{DDIO}	I/O Supply Voltage. 1.8V ≤ V _{DDIO} ≤ 3.6V. See EC table for V _{DDIO} specification. This pin must be bypassed to V _{SS} with a 1.0μF capacitor as close as possible to the package. This pin can be connected to V _{DD18} for legacy I/O support.
46	A8	V _{DDIOH}	I/O Supply Voltage, High. 1.8V ≤ V _{DDIOH} ≤ 3.6V, always with V _{DDIO} ≤ V _{DDIOH} . See EC table for V _{DDIOH} specification. This pin must be bypassed to V _{SS} with a 1.0μF capacitor as close as possible to the package. This pin can be connected to V _{DD18} for legacy I/O support.
34	A3	V _{REF}	ADC Reference. This pin should be left unconnected if an external reference is not used.
3, 7, 42, 58, 60, 62, 90	B8, D9, G1, J5	V _{SS}	Digital Ground.
33	A2	V _{SSA}	Analog Ground. This pin must be connected to V _{SS} .
EP	—	EP	Exposed Pad (TQFP Only). This pad must be connected to V _{SS} . Refer to Application Note 3273: Exposed Pads: A Brief Introduction for additional information.
CLOCKS			
55	B9	32KIN	32kHz Crystal Oscillator Input/Output. Connect a 6pF 32kHz crystal between 32KIN and 32KOUT for RTC operation. Optionally, an external clock source can be driven on 32KIN if the 32KOUT pin is left unconnected. A 32kHz crystal or external clock source is required for proper USB operation.
56	C9	32KOUT	
USB			
64	E8	DP	USB D+ Signal. This bidirectional pin carries the positive differential data or single-ended data. This pin is weakly pulled high internally when the USB is disabled.
65	F8	DM	USB D- Signal. This bidirectional pin carries the negative differential data or single-ended data. This pin is weakly pulled high internally when the USB is disabled.
JTAG			
31	B4	TCK	JTAG Clock Serial Wire Debug Clock This pin has an internal 25kΩ pullup to V _{DDIO} .

Pin Description (continued)

PIN		NAME	FUNCTION
TQFP	WLP		
36	B5	TMS	JTAG Test Mode Select Serial Wire Debug I/O This pin has an internal 25kΩ pullup to V _{DDIO} .
38	B6	TDO	JTAG Test Data Output
40	B7	TDI	JTAG Test Data Input. This pin has an internal 25kΩ pullup to V _{DDIO} .
RESET			
22	B2	$\overline{\text{RSTN}}$	Hardware Reset, Active-Low Input. The device remains in reset while this pin is in its active state. When the pin transitions to its inactive state, the device performs a POR reset (resetting all logic on all supplies except for real-time clock circuitry) and begins execution. This pin has an internal 25kΩ pullup to the V _{RTC} supply. This pin should be left unconnected if the system design does not provide a reset signal to the device.
23	B1	$\overline{\text{SRSTN}}$	Software Reset, Active-Low Input/Output. The device remains in software reset while this pin is in its active state. When the pin transitions to its inactive state, the device performs a reset to the ARM core, digital registers and peripherals (resetting most of the core logic on the V _{DD12} supply). This reset does not affect the POR only registers, RTC logic, ARM debug engine or JTAG debugger allowing for a soft reset without having to reconfiguring all registers. After the device senses $\overline{\text{SRSTN}}$ as a logic 0, the pin automatically reconfigures as an output sourcing a logic 0. The device continues to output for 6 system clock cycles and then repeats the input sensing/output driving until $\overline{\text{SRSTN}}$ is sensed inactive. This pin is internally connected with an internal 25kΩ pullup to the V _{RTC} supply. This pin should be left unconnected if the system design does not provide a reset signal to the device.
GENERAL-PURPOSE I/O AND SPECIAL FUNCTIONS

MAX32620/MAX32621

Detailed Description

The MAX32620/MAX32621 is a low-power, mixed signal microcontroller that includes the ARM Cortex-M4 with FPU core with a maximum operating frequency of 96MHz. An internal 4MHz oscillator supports minimal power consumption for applications requiring always-on monitoring. The MAX32621 is a secure version, incorporating a trust protection unit (TPU) with encryption and advanced security features.

Application code executes from an onboard 2MB/1MB program flash memory, with 256KB SRAM available for general application use. An 8KB instruction cache improves execution throughput, and a transparent code scrambling scheme protects customer intellectual property residing in the program flash memory. Additionally, a SPI execute in place (SPIX) external memory interface allows application code and data (up to 16MB) to be accessed from an external SPI memory device.

A 10-bit sigma-delta ADC is provided with a multiplexer front end for four external input channels (two of which are 5.5V tolerant) and internal channels to monitor supply voltages. Built-in limit monitors allow converted input samples to be compared against user-configurable high and low limits, with an option to trigger an interrupt and wake the CPU from a low power mode if attention is required.

A wide variety of communications and interface peripherals are provided, including a USB 2.0-compliant slave interface, three master SPI interfaces, four UART interfaces with multidrop support, three master I²C interfaces, and a slave I²C interface.

ARM Cortex-M4 with FPU Core

The ARM Cortex-M4 with FPU core is ideal for the emerging category of wearable medical and wellness applications. The architecture combines high-efficiency signal processing functionality with low power, low cost, and ease of use.

- Floating Point Unit (FPU)
- Memory Protection Unit
- Full debug support level
 - Debug Access Port (DAP)
 - Breakpoints
 - DWT
 - Flash patch
 - Halting debug

- Debug access port : JTAG or serial wire
- NVIC support
 - 52 interrupts to be grouped by firmware into 8 levels of priority
- DSP supports Single Instruction Multiple Data (SIMD) Path DSP extensions, providing:
 - 4 parallel 8 bit add/sub
 - 2 parallel 16 bit add/sub
 - 2 parallel MACs
 - 32 or 64 bit accumulate
 - Signed, unsigned, data with or without saturation

Power Operating Modes

Low Power Mode 0 (LP0)

This mode places the core and peripheral logic in a static, low-power state. All features of the device are disabled except:

- Power sequencer
- RTC (if enabled)
- Key data retention registers
- Power-on reset
- Voltage supply monitoring

Data retention in this mode can be maintained using only the V_{RTC} supply, with all other voltage supplies disabled.

Low Power Mode 1 (LP1)

This mode places the core logic in a static, low-power state which supports a fast wakeup feature. Data retention in this mode can be maintained using only the V_{RTC} supply, with all other voltage supplies disabled.

Low Power Mode 2 (LP2)

This configuration allows the ADC and some peripherals to operate while the ARM core is in sleep mode. The peripheral management unit provides intelligent, dynamic clocking of any enabled peripherals, ensuring the lowest power consumption possible.

Low Power Mode 3 (LP3)

During this state, the CPU is executing application code and all digital and analog peripherals are fully powered and awake. Dynamic clocking disables peripherals not in use, providing the optimal mix of high-performance and low power consumption.

Analog to Digital Converter (ADC)

The 10-bit sigma-delta ADC provides 4 external inputs and can also be configured to measure all internal power supplies. It operates at a maximum of 7.8ksps. AIN0 and AIN1 are 5.5V tolerant, making them suitable for monitoring batteries.

An optional feature allows samples captured by the ADC to be automatically compared against user-programmable high and low limits. Up to four channel limit pairs can be configured in this way. The comparison allows the ADC to trigger an interrupt (and potentially wake the CPU from a low power sleep mode) when a captured sample goes outside the preprogrammed limit range. Since this comparison is performed directly by the sample limit monitors, it can be performed even while the main CPU is suspended in a low-power mode.

The ADC reference can be the internal 1.2V bandgap or an external reference.

The ADC measures:

- AIN[3:2] (up to 3.3V)
- AIN[1:0] (up to 5.5V)
- V_{DD12}
- V_{DD18}
- V_{DDB}
- V_{RTC}
- V_{DDIO}
- V_{DDIOH}

Pulse Train Engine

Sixteen independent pulse train generators provide either a square wave or a repeating pattern from 2 bits to 32 bits in length.

Each pulse train generator is independently configurable. The pulse train generators provide the following:

- Independently enabled
- Multiple pin configurations allow for flexible layout
- Pulse trains can be started/synchronized independently or as a group
- Frequency of each enabled pulse train generator is also set separately, based on a divide down (divide by 2, divide by 4, divide by 8, and so on) of the input pulse train module clock
- Multiple repetition options for pulse train mode
 - Single shot (nonrepeating pattern of 2-32 bits)
 - Pattern repeats user-configurable number of times or indefinitely
 - End of one pulse train's loop count can restart one or more other pulse trains

Clocking Scheme

The high-frequency internal relaxation oscillator operates at a nominal frequency of 96MHz. It is the primary clock source for the digital logic and peripherals. The 4MHz internal oscillator can be selected to optimize active power consumption. Wakeup is possible from either the 4MHz or the 96MHz internal oscillator.

An external 32.768kHz timebase is required when using the RTC or USB features of the device. The time base can be generated by attaching a 32kHz crystal. An external clock source can also be applied to the 32KIN pin. The external clock source must meet the electrical/timing requirements in the EC table.

Interrupt Sources

The ARM nested vector interrupt controller (NVIC) provides high speed, deterministic interrupt response, interrupt masking, and multiple interrupt sources. Each peripheral is connected to the NVIC and can have multiple interrupt flags to indicate the specific source of the interrupt within the peripheral.

The NVIC provides:

- Up to 52 distinct interrupt sources (including internal and external interrupts)
- Eight priority levels
- A dedicated interrupt for each port

Real-Time Clock

A real-time clock (RTC) keeps the time of day in absolute seconds. The time base can be generated by connecting a 32kHz crystal between 32KIN and 32KOUT or an external clock source can be applied to the 32KIN pin. The external clock source must meet the electrical/timing requirements in the EC table. The 32kHz output can be directed to a GPIO for observation and use.

The 32-bit seconds register can count up to approximately 136 years and be translated to calendar format by application software. A time-of-day alarm and independent subsecond alarm can cause an interrupt or wake the device from stop mode.

The wake-up timer allows the device to remain in low power mode for extended periods of time. The minimum wake-up interval is 244μs.

General Purpose I/O and Special Function Pins

General-purpose I/O (GPIO) pins are controlled directly by firmware or one or more peripheral modules connected to that pin. GPIO are logically divided into 8-pin ports. Each 8-bit port provides a dedicated interrupt.

The alternate functions for each pin are shown in [Table 1](#).

The following features are independently configurable for each GPIO pin:

- GPIO or special function mode operation
- V_{DDIO} or V_{DDIOH} supply voltage
- V_{DDI18} GPIO supply voltage supported for legacy operation
- Normal and fast output drive strength
- Open-drain output or high-impedance input
- Configurable strong or weak internal pullup/pulldown resistors
- Simple output-only functions
 - Output from pulse trains (0 through 15)
 - Output from timers running in 32-bit mode

Some peripherals have optional pin assignments, allowing for greater flexibility during PCB layout. These optional pin assignments are identified with the letter B, C, or D after the peripheral name. On the MAX32620/MAX32621, the UART0_RX signal is mapped to the P0.0 pin. If the B configuration is chosen, the UART0_RX signal is mapped to the P0.1 pin.

CRC Module

The CRC hardware module provides fast calculations and data integrity checks by application software. The CRC module supports both the CRC-16-CCITT and CRC-32 ($X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X^1 + 1$) polynomials.

Watchdog Timers

Two independent watchdog timers (WDT0 and WDT1) with window support are provided. The WDT has multiple clock source options to ensure system security. It uses a 32-bit timer with prescaler to generate the watchdog reset. When enabled, the WDT must be reset prior to timeout or within a window of time if window mode is enabled. Failure to reset the WDT during the programmed timing window results in a watchdog timeout. WDT resets can cause firmware or power-on resets. The WDT0 or WDT1 flags are set on reset if a watchdog expiration

caused the system reset. The clock source options for the WDT include:

- Scaled-system clock
- RTC clock
- Power management clock

A third watchdog timer (WDT2) is provided for recovery from runaway code or system unresponsiveness. When enabled, this watchdog must be reset prior to timeout, resulting in a watchdog timeout. The WDT2 flag is set on reset if a watchdog expiration caused the system reset.

WDT2 is unique in that it is in the always-on domain, and continues to run even in LP1 or LP0. The timeout period for WDT2 can be programmed as long as 8 seconds. The granularity of the timeout period is intended only for system recovery.

Programmable Timers

Six 32-bit timers provide timing, capture/compare, or generation of pulse-width modulated (PWM) signals. Each timer can be split into 2 16-bit timers, enabling 12 standard 16-bit timers.

32-bit timer features:

- 32-bit up/down auto-reload
- Programmable 16-bit prescaler
- PWM output generation
- Capture, compare, and capture/compare capability
- External input pin for timer input, clock gating or capture, limited to an input frequency of $\frac{1}{4}$ of the peripheral clock frequency
- Timer output pin
- Configurable as 2x 16-bit general purpose timers
- Timer interrupt

Serial Peripherals

USB Controller

The integrated USB controller is compliant with the full-speed (12Mb/s) USB 2.0 specification. The integrated USB physical interface (PHY) reduces board space and system cost. An integrated voltage regulator allows for smart switching between the main supply and V_{DDB} when connected to a USB host controller.

The USB controller supports DMA for the endpoint buffers. A total of 7 endpoint buffers are supported with configurable selection of IN or OUT in addition to endpoint 0.

1-Wire Master

Maxim's DeepCover® 1-Wire security solutions provide a cost-effective solution to authenticate medical sensors and peripherals, preventing counterfeit products. The integrated 1-Wire master communicates with slave devices via the bidirectional, multidrop 1-Wire bus. All of the devices on the 1-Wire bus share one signal which carries data communication and also supplies power to the slave devices. The single contact serial interface is ideal for communication networks requiring minimal interconnect. Features of the 1-Wire bus include:

- Single contact for control and operation
- Unique factory identifier for any 1-Wire device
- Power is distributed to all slave device (parasitic power)
- Multiple device capability on a single line
- Supports 1-Wire standard (15.6kbps) and overdrive (110 kbps) speeds

The incorporation of the 1-Wire master enables the creation of 1-Wire enhanced of consumable and reusable accessories. The following benefits can be added to products by the addition of only one contact:

- OEM authenticity is verifiable with SHA-256 and ECDSA
- External tracking is eliminated because calibration data can be securely stored within accessory
- Reuse of single-use accessories can be prevented
- Counterfeit products can be identified and use denied using the unique, factory identifier
- Environmental temperature and humidity sensing

Trust Protection Unit (TPU) (MAX32621 Only)

The TPU enhances cryptographic data security for valuable intellectual property (IP) and data. A high-speed, dedicated, hardware-based math accelerator (MAA) performs mathematical computations that support strong cryptographic algorithms including:

- AES-128
- AES-192
- AES-256
- 1024-bit DSA
- 2048-bit (CRT)

The device provides a pseudo-random number generator which can be used to create cryptographic keys for any application. A user-selectable entropy source further increases the randomness and key strength.

The secure bootloader protects against unauthorized access to program memory.

DeepCover is a registered trademark of Maxim Integrated Products, Inc.

Peripheral Management Unit (PMU)

The PMU is a DMA-based link list processing engine that performs operations and data transfers involving memory and/or peripherals in the advanced peripheral bus (APB) and advanced high-performance bus (AHB) peripheral memory space while the main CPU is in a sleep state. This allows low-overhead peripheral operations to be performed without the CPU, significantly reducing overall power consumption. Using the PMU with the CPU in a sleep state provides a lower-noise environment critical for obtaining optimum ADC performance.

Key features of the PMU engine include:

- Six independent channels with round-robin scheduling allows for multiple parallel operations
- Programmed using SRAM-based PMU opcodes
- PMU action can be initiated from interrupt conditions from peripherals without CPU
- Integrated AHB bus master
- Coprocessor-like state machine

Additional Documentation

Engineers must have the following documents to fully use this device:

- This data sheet, containing pin descriptions, feature overviews, and electrical specifications
- The device-appropriate user guide, containing detailed information and programming guidelines for core features and peripherals
- Errata sheets for specific revisions noting deviations from published specifications.

For information regarding these documents, visit Technical Support at support.maximintegrated.com/micro.

Development and Technical Support

Contact technical support for information about highly versatile, affordable development tools, available from Maxim Integrated and third-party vendors.

- Evaluation kits
- Software development kit
- Compilers
- Integrated development environments (IDEs)
- USB interface modules for programming and debugging

Typical Application Circuit—Wearable Cardiac Monitor

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	6/15	Initial release	—
1	1/17	Added 4MHz clock option to EC table, added new GPIO V_{DDIO}/V_{DDIOH} option while supporting legacy V_{DD18} I/O supply to EC table, pin configuration, and pin description, absolute maximum rating for V_{RTC} changed from 3.6V to 1.89V, $V_{AIN(MIN)}$ typo corrected from V_{SS} to V_{SSA} , $RSTN$ pin supply corrected from V_{DD18} to V_{RTC} , added I ² C and SPI timings, updated feature descriptions to conform to MAX32625/MAX32626 style, corrected Table 1 title, corrected part number in detailed description, added text in General Description describing differences between “C” and “A” revisions of the device, corrected RTC frequency to 32.768kHz, changed instances of WTD to WDT, corrected instances of $T_A = +20^{\circ}\text{C}$ to $T_A = +25^{\circ}\text{C}$, changed page 1 typical values from current to power, updated I_{DDXX} typical values, removed redundant feature list on page 26, removed references to SPI bridge from I/O Matrix as the feature was never implemented, recommended V_{DD12} bypass capacitor changed from 100nF to 1.0μF, corrected ARM Cortex trademark usage in text and figures, I_{IH3V} min/max from ± 1 to ± 2 , $V_{RST(MIN)}$ from 1.62V to 1.61V, f_{INTCLK} min/max from 94.08/97.92 to 94/98MHz, corrected $f_{RCCLK(MIN)}$ from 3.9 to 0.001MHz to clarify effect of clock divider option, but no change to device, moved 1-Wire Master I/O to Table 1, added MAX32620IWGL+ and MAX32620IWGL+T part numbers	1–8, 10–16, 18–26

For pricing, delivery, and ordering information, please contact Maxim Direct at 1-888-629-4642, or visit Maxim Integrated's website at www.maximintegrated.com.
