
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	40MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	36
Program Memory Size	16KB (8K x 16)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	768 x 8
Voltage - Supply (Vcc/Vdd)	4.2V ~ 5.5V
Data Converters	A/D 13x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	40-DIP (0.600", 15.24mm)
Supplier Device Package	40-PDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18f4410-i-p

TABLE 2-1: PIN DESCRIPTIONS (DURING PROGRAMMING): PIC18F2XXX/4XXX FAMILY

Pin Name	During Programming		
	Pin Name	Pin Type	Pin Description
MCLR/VPP/RE3	VPP	P	Programming Enable
VDD(2)	VDD	P	Power Supply
VSS(2)	VSS	P	Ground
RB5	PGM	I	Low-Voltage ICSP™ Input when LVP Configuration bit equals '1'(1)
RB6	PGC	I	Serial Clock
RB7	PGD	I/O	Serial Data

Legend: I = Input, O = Output, P = Power
Note 1: See Figure 5-1 for more information.
2: All power supply (VDD) and ground (VSS) pins must be connected.

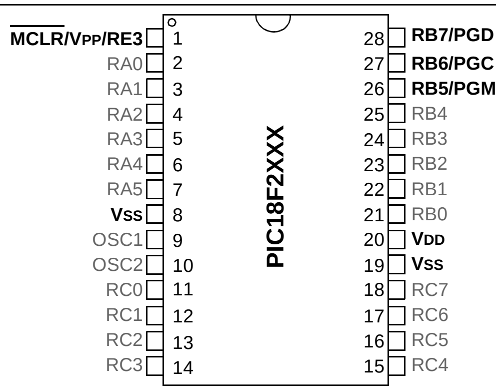
The following devices are included in 28-pin SPDIP, PDIP and SOIC parts:

- PIC18F2221
- PIC18F2321
- PIC18F2410
- PIC18F2420
- PIC18F2423
- PIC18F2450
- PIC18F2455
- PIC18F2458
- PIC18F2480
- PIC18F2510
- PIC18F2515
- PIC18F2520
- PIC18F2523
- PIC18F2525
- PIC18F2550
- PIC18F2553
- PIC18F2580
- PIC18F2585
- PIC18F2610
- PIC18F2620
- PIC18F2680
- PIC18F2682
- PIC18F2685

The following devices are included in 28-pin SSOP parts:

- PIC18F2221
- PIC18F2321

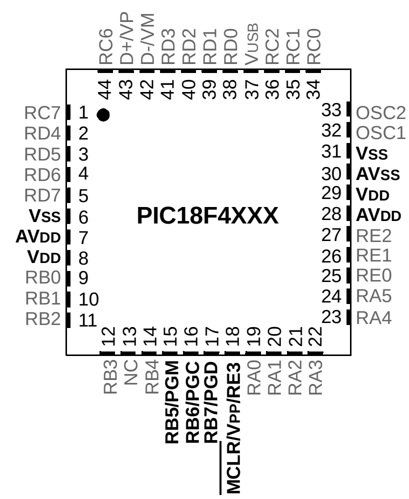
FIGURE 2-1: 28-Pin SPDIP, PDIP, SOIC,SSOP



The following devices are included in 44-pin QFN parts:

- PIC18F4221
- PIC18F4321
- PIC18F4410
- PIC18F4420
- PIC18F4423
- PIC18F4450
- PIC18F4455
- PIC18F4458
- PIC18F4480
- PIC18F4510
- PIC18F4520
- PIC18F4515
- PIC18F4523
- PIC18F4525
- PIC18F4550
- PIC18F4553
- PIC18F4580
- PIC18F4585
- PIC18F4610
- PIC18F4620
- PIC18F4680
- PIC18F4682
- PIC18F4685

FIGURE 2-5: 44-PIN QFN



2.3 Memory Maps

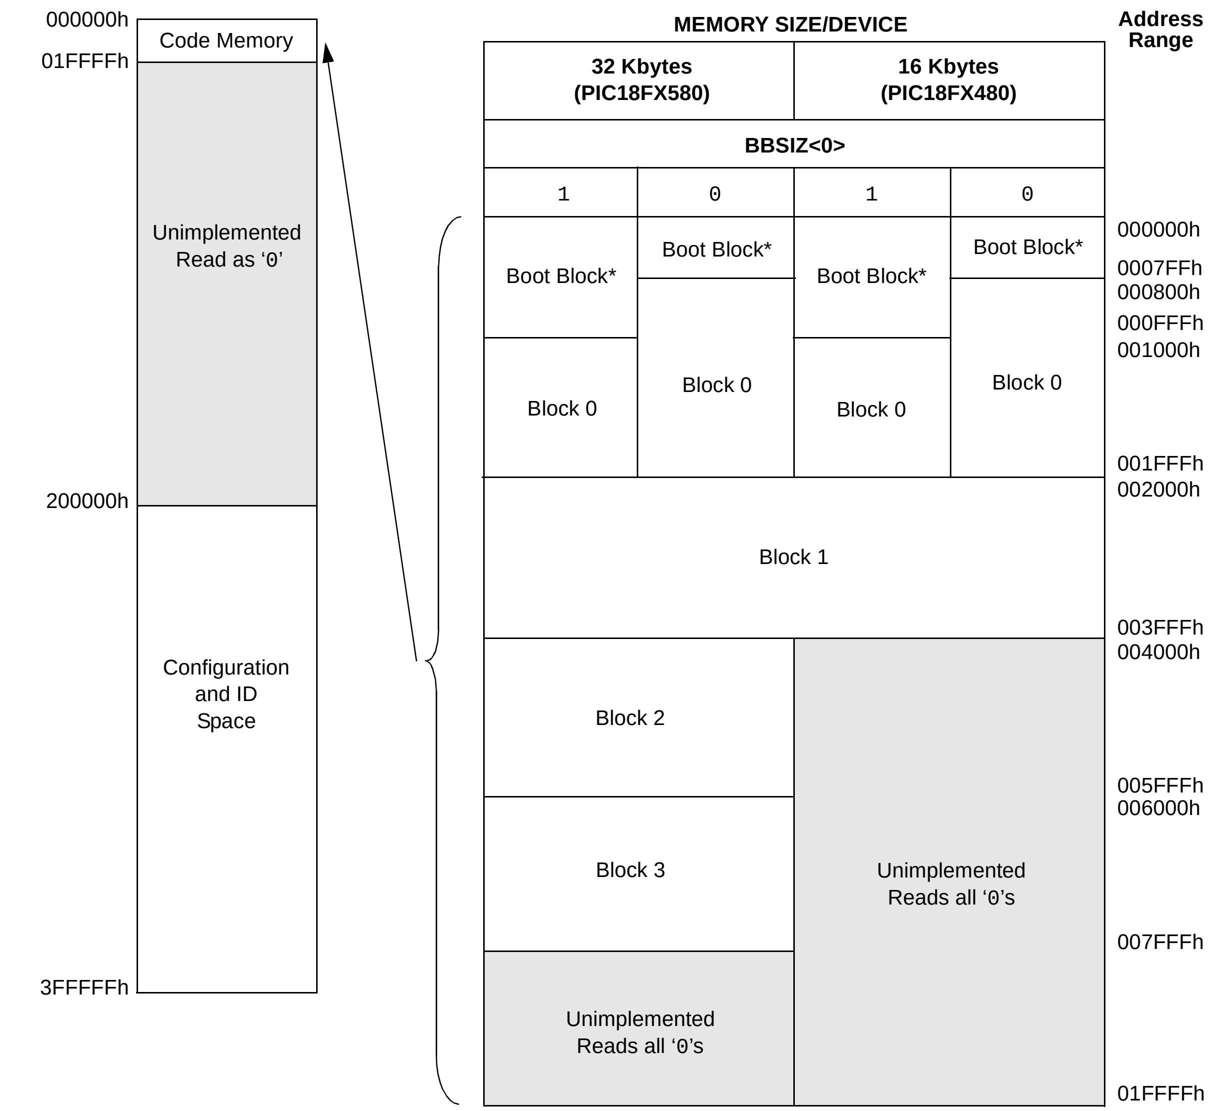
For PIC18FX6X0 devices, the code memory space extends from 0000h to 0FFFFh (64 Kbytes) in four 16-Kbyte blocks. For PIC18FX5X5 devices, the code memory space extends from 0000h to 0BFFFFh (48 Kbytes) in three 16-Kbyte blocks. Addresses, 0000h through 07FFh, however, define a “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

The size of the Boot Block in PIC18F2585/2680/4585/4680 devices can be configured as 1, 2 or 4K words (see Figure 2-6). This is done through the BBSIZ<1:0> bits in the Configuration register, CONFIG4L. It is important to note that increasing the size of the Boot Block decreases the size of Block 0.

TABLE 2-6: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2480	000000h-003FFFh (16K)
PIC18F4480	
PIC18F2580	000000h-007FFFh (32K)
PIC18F4580	

FIGURE 2-10: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18F2480/2580/4480/4580 DEVICES



Note: Sizes of memory areas are not to scale.
* Boot Block size is determined by the BBSIZ<0> bit in the CONFIG4L register.

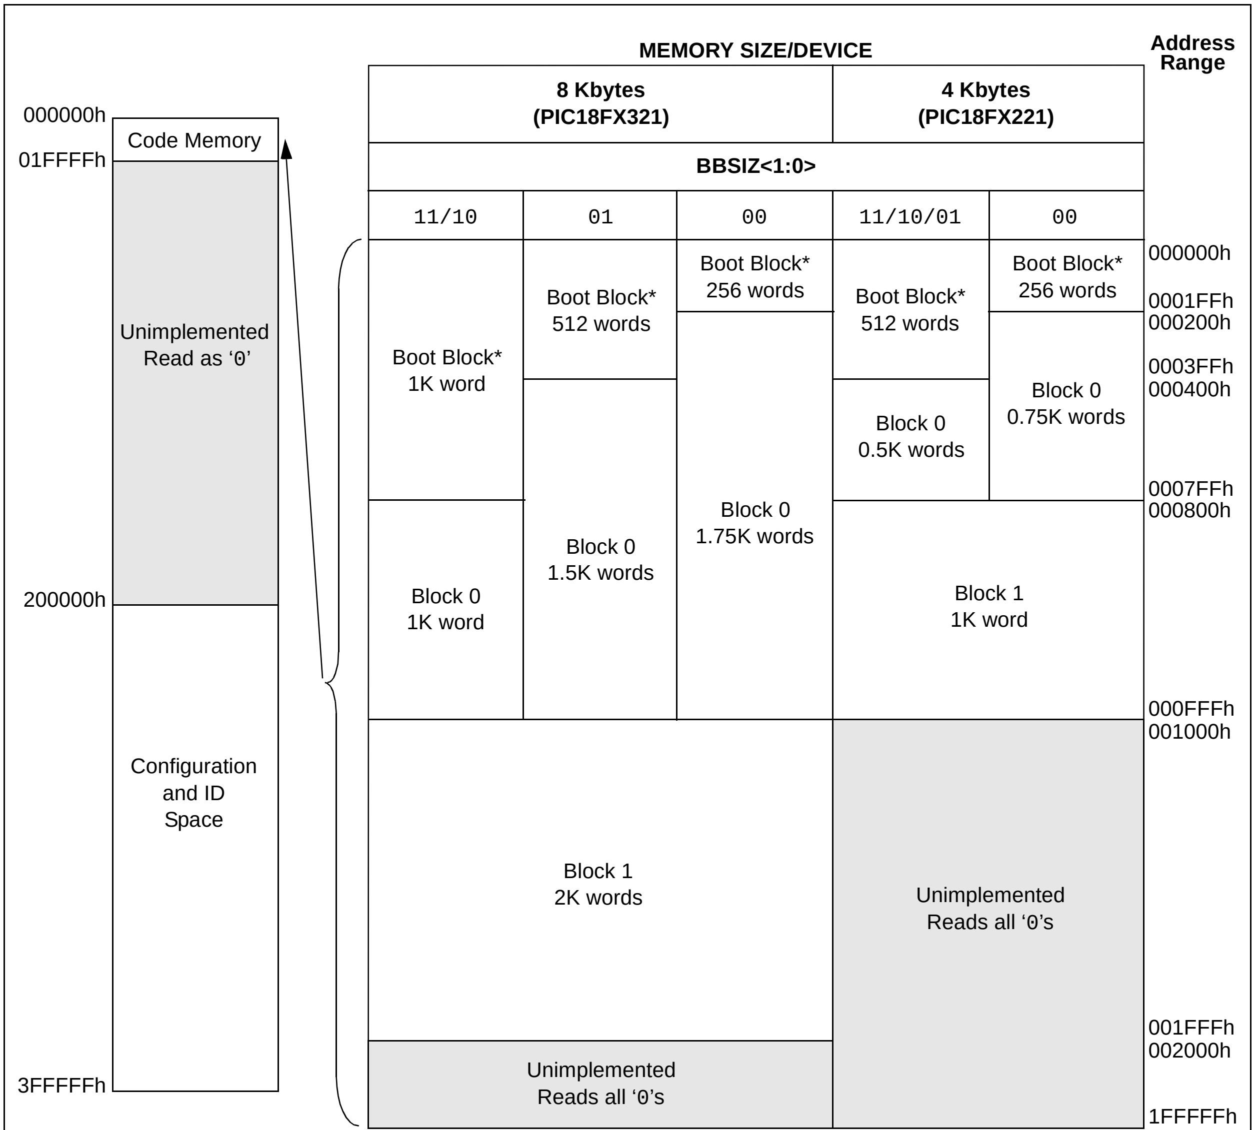
For PIC18F2221/4221 devices, the code memory space extends from 0000h to 00FFFh (4 Kbytes) in one 4-Kbyte block. For PIC18F2321/4321 devices, the code memory space extends from 0000h to 01FFFh (8 Kbytes) in two 4-Kbyte blocks. Addresses, 0000h through 07FFh, however, define a variable "Boot Block" region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

The size of the Boot Block in PIC18F2221/2321/4221/4321 devices can be configured as 256, 512 or 1024 words (see Figure 2-11). This is done through the BBSIZ<1:0> bits in the Configuration register, CONFIG4L (see Figure 2-11). It is important to note that increasing the size of the Boot Block decreases the size of Block 0.

TABLE 2-7: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2221	000000h-000FFFh (4K)
PIC18F4221	
PIC18F2321	000000h-001FFFh (8K)
PIC18F4321	

FIGURE 2-11: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18F2221/2321/4221/4321 DEVICES



Note: Sizes of memory areas are not to scale.
* Boot Block size is determined by the BBSIZ<1:0> bits in the CONFIG4L register.

In addition to the code memory space, there are three blocks that are accessible to the user through Table Reads and Table Writes. Their locations in the memory map are shown in Figure 2-12.

Users may store identification information (ID) in eight ID registers. These ID registers are mapped in addresses, 200000h through 200007h. The ID locations read out normally, even after code protection is applied.

Locations, 300000h through 30000Dh, are reserved for the Configuration bits. These bits select various device options and are described in **Section 5.0 "Configuration Word"**. These Configuration bits read out normally, even after code protection.

Locations, 3FFFFEh and 3FFFFFh, are reserved for the Device ID bits. These bits may be used by the programmer to identify what device type is being programmed and are described in **Section 5.0 "Configuration Word"**. These Device ID bits read out normally, even after code protection.

2.3.1 MEMORY ADDRESS POINTER

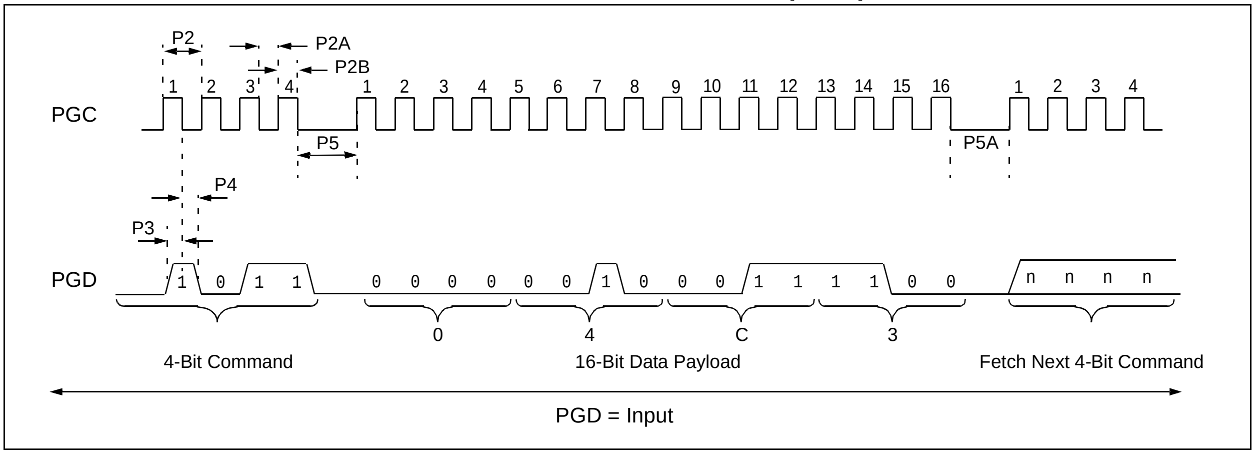
Memory in the address space, 0000000h to 3FFFFFh, is addressed via the Table Pointer register, which is comprised of three pointer registers:

- TBLPTRU at RAM address 0FF8h
- TBLPTRH at RAM address 0FF7h
- TBLPTRL at RAM address 0FF6h

TBLPTRU	TBLPTRH	TBLPTRL
Addr[21:16]	Addr[15:8]	Addr[7:0]

The 4-bit command, '`0000`' (core instruction), is used to load the Table Pointer prior to using many read or write operations.

FIGURE 2-18: TABLE WRITE, POST-INCREMENT TIMING (1101)



2.8 Dedicated ICSP/ICD Port (44-Pin TQFP Only)

The PIC18F4455/4458/4550/4553 44-pin TQFP devices are designed to support an alternate programming input: the dedicated ICSP/ICD port. The primary purpose of this port is to provide an alternate In-Circuit Debugging (ICD) option and free the pins (RB6, RB7 and MCLR) that would normally be used for debugging the application. In conjunction with ICD capability, however, the dedicated ICSP/ICD port also provides an alternate port for ICSP.

Setting the ICPRT Configuration bit enables the dedicated ICSP/ICD port. The dedicated ICSP/ICD port functions the same as the default ICSP/ICD port; however, alternate pins are used instead of the default pins. Table 2-10 identifies the functionally equivalent pins for ICSP purposes:

The dedicated ICSP/ICD port is an alternate port. Thus, ICSP is still available through the default port even though the ICPRT Configuration bit is set. When the VIH is seen on the MCLR/VPP/RE3 pin prior to applying VIH to the ICRST/ICVPP pin, then the state of the ICRST/ICVPP pin is ignored. Likewise, when the VIH is seen on ICRST/ICVPP prior to applying VIH to MCLR/VPP/RE3, then the state of the MCLR/VPP/RE3 pin is ignored.

Note: The ICPRT Configuration bit can only be programmed through the default ICSP port. Chip Erase functions through the dedicated ICSP/ICD port do not affect this bit.

When the ICPRT Configuration bit is set (dedicated ICSP/ICD port enabled), the NC/ICPORTS pin must be tied to either VDD or VSS.

The ICPRT Configuration bit must be maintained clear for all 28-pin and 40-pin devices; otherwise, unexpected operation may occur.

TABLE 2-10: ICSP™ EQUIVALENT PINS

Pin Name	During Programming			
	Pin Name	Pin Type	Dedicated Pins	Pin Description
MCLR/VPP/RE3	VPP	P	NC/ICRST/ICVPP	Programming Enable
RB6	PGC	I	NC/ICCK/ICPGC	Serial Clock
RB7	PGD	I/O	NC/ICDT/ICPGD	Serial Data

Legend: I = Input, O = Output, P = Power

TABLE 3-3: ERASE CODE MEMORY CODE SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory and enable writes.		

0000
0000
0000
	8E A6
	9C A6
	84 A6
		`BSF EECON1, EEPGD`
		`BCF EECON1, CFGS`
		`BSF EECON1, WREN`

Step 2: Point to first row in code memory.		

0000
0000
0000
	6A F8
	6A F7
	6A F6
		`CLRF TBLPTRU`
		`CLRF TBLPTRH`
		`CLRF TBLPTRL`

Step 3: Enable erase and erase single row.		

0000
0000
0000
	88 A6
	82 A6
	00 00
		`BSF EECON1, FREE`
		`BSF EECON1, WR`
		`NOP – hold PGC high for time P9 and low for time P10.`

Step 4: Repeat Step 3, with the Address Pointer incremented by 64 until all rows are erased.		

FIGURE 3-3: SINGLE ROW ERASE CODE MEMORY FLOW

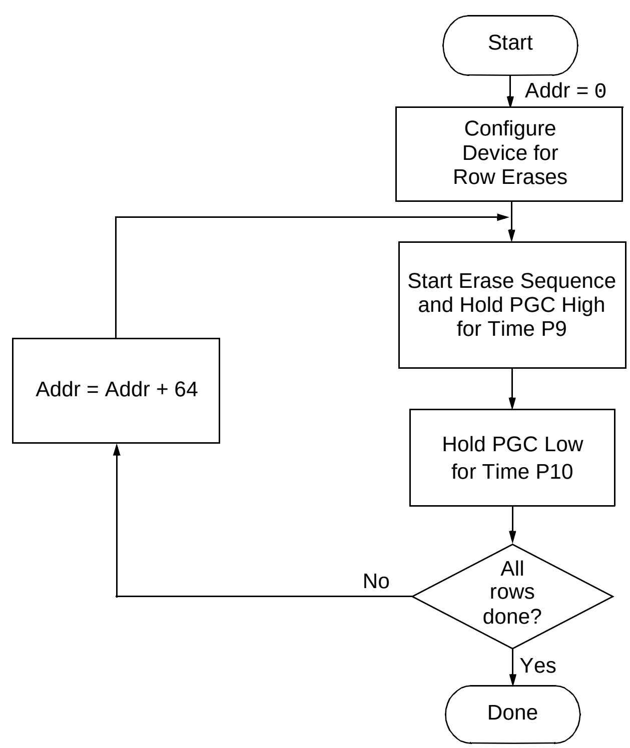


FIGURE 3-4: PROGRAM CODE MEMORY FLOW

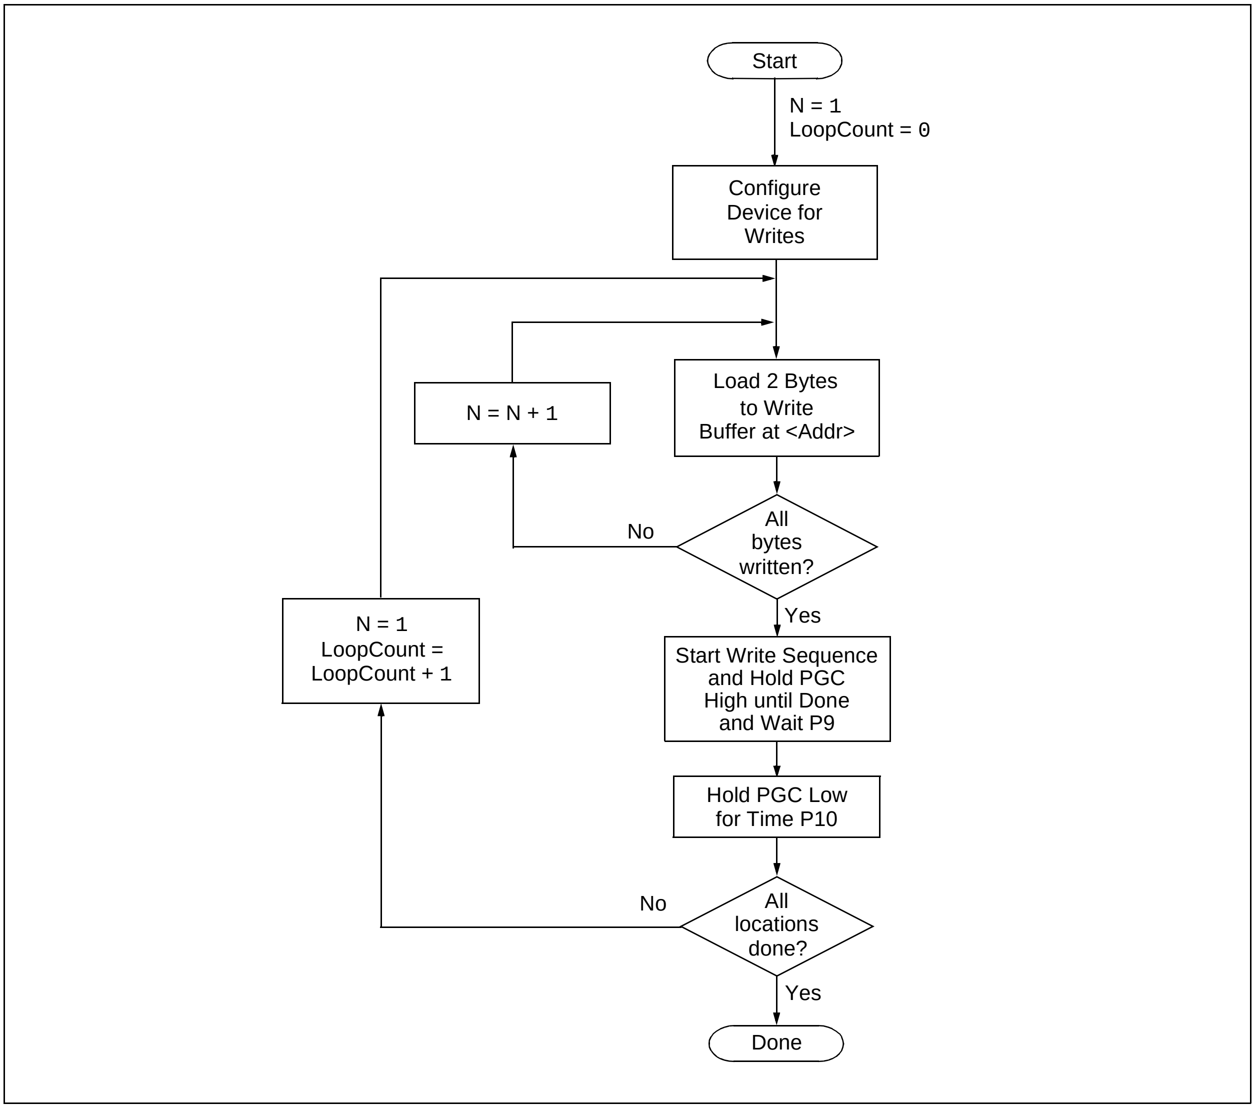

FIGURE 3-5: TABLE WRITE AND START PROGRAMMING INSTRUCTION TIMING (1111)

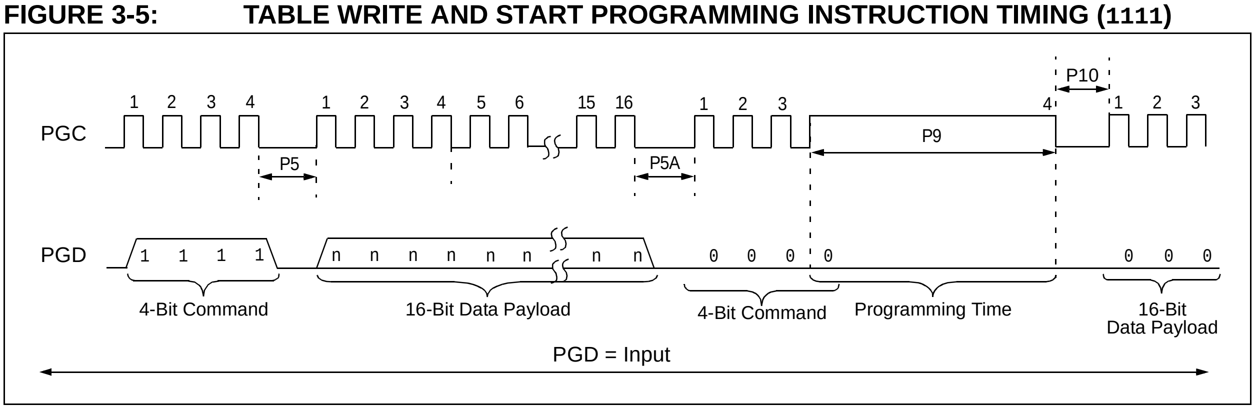

3.3 Data EEPROM Programming

Note: Data EEPROM programming is **not** available on the following devices:

PIC18F2410	PIC18F4410
PIC18F2450	PIC18F4450
PIC18F2510	PIC18F4510
PIC18F2515	PIC18F4515
PIC18F2610	PIC18F4610

Data EEPROM is accessed one byte at a time via an Address Pointer (register pair: EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is written by loading EEADRH:EEADR with the desired memory location, EEDATA, with the data to be written and initiating a memory write by appropriately configuring the EECON1 register. A byte write automatically erases the location and writes the new data (erase-before-write).

When using the EECON1 register to perform a data EEPROM write, both the EEPGD and CFGS bits must be cleared (EECON1<7:6> = 00). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort and this must be done prior to initiating a write sequence. The write sequence is initiated by setting the WR bit (EECON1<1> = 1).

The write begins on the falling edge of the 4th PGC after the WR bit is set. It ends when the WR bit is cleared by hardware.

After the programming sequence terminates, PGC must still be held low for the time specified by Parameter P10 to allow high-voltage discharge of the memory array.

FIGURE 3-6: PROGRAM DATA FLOW

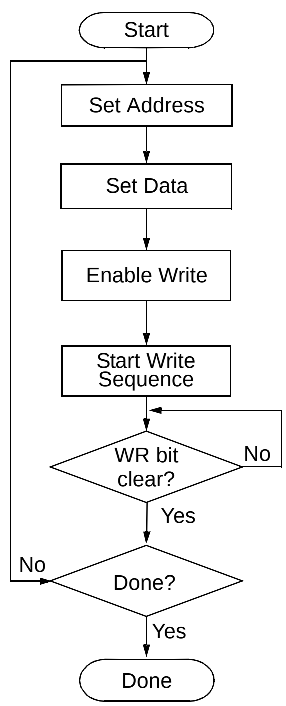

TABLE 3-7: PROGRAMMING DATA MEMORY

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to data EEPROM.		
0000 0000	9E A6 9C A6	BCF EECON1, EEPGD BCF EECON1, CFGS
Step 2: Set the data EEPROM Address Pointer.		
0000 0000 0000 0000	0E <Addr> 6E A9 OE <AddrH> 6E AA	MOVLW <Addr> MOVWF EEADR MOVLW <AddrH> MOVWF EEADRH
Step 3: Load the data to be written.		
0000 0000	0E <Data> 6E A8	MOVLW <Data> MOVWF EEDATA
Step 4: Enable memory writes.		
0000	84 A6	BSF EECON1, WREN
Step 5: Initiate write.		
0000	82 A6	BSF EECON1, WR
Step 6: Poll WR bit, repeat until the bit is clear.		
0000 0000 0000 0010	50 A6 6E F5 00 00 <MSB><LSB>	MOVF EECON1, W, 0 MOVWF TABLAT NOP Shift out data(1)
Step 7: Hold PGC low for time P10.		
Step 8: Disable writes.		
0000	94 A6	BCF EECON1, WREN
Repeat Steps 2 through 8 to write more data.		

Note 1: See Figure 4-4 for details on shift out data timing.

3.4 ID Location Programming

The ID locations are programmed much like the code memory. The ID registers are mapped in addresses, 200000h through 200007h. These locations read out normally even after code protection.

Note:	The user only needs to fill the first 8 bytes of the write buffer in order to write the ID locations.

Table 3-8 demonstrates the code sequence required to write the ID locations.

In order to modify the ID locations, refer to the methodology described in **Section 3.2.1 “Modifying Code Memory”**. As with code memory, the ID locations must be erased before being modified.

TABLE 3-8: WRITE ID SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory and enable writes.		
0000 0000	8E A6 9C A6	BSF EECON1, EEPGD BCF EECON1, CFGS
Step 2: Load write buffer with 8 bytes and write.		
0000 0000 0000 0000 0000 0000 1101 1101 1101 1111 0000	0E 20 6E F8 0E 00 6E F7 0E 00 6E F6 <MSB><LSB> <MSB><LSB> <MSB><LSB> <MSB><LSB> 00 00	MOVLW 20h MOVWF TBLPTRU MOVLW 00h MOVWF TBLPTRH MOVLW 00h MOVWF TBLPTRL Write 2 bytes and post-increment address by 2. Write 2 bytes and post-increment address by 2. Write 2 bytes and post-increment address by 2. Write 2 bytes and start programming. NOP - hold PGC high for time P9 and low for time P10.

3.5 Boot Block Programming

The code sequence detailed in Table 3-5 should be used, except that the address used in “Step 2” will be in the range of 000000h to 0007FFh.

3.6 Configuration Bits Programming

Unlike code memory, the Configuration bits are programmed a byte at a time. The Table Write, Begin Programming 4-bit command (‘1111’) is used, but only eight bits of the following 16-bit payload will be written. The LSB of the payload will be written to even addresses and the MSB will be written to odd addresses. The code sequence to program two consecutive configuration locations is shown in Table 3-9.

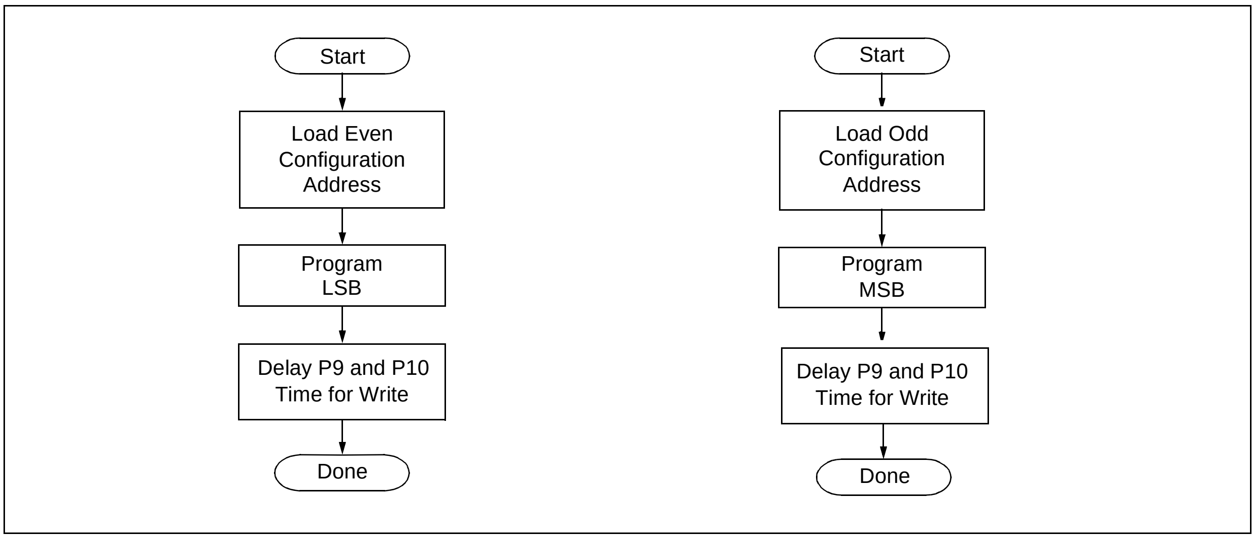
Note:	The address must be explicitly written for each byte programmed. The addresses can not be incremented in this mode.

TABLE 3-9: SET ADDRESS POINTER TO CONFIGURATION LOCATION

4-Bit Command	Data Payload	Core Instruction
Step 1: Enable writes and direct access to configuration memory.		
0000	8E A6	BSF EECON1, EEPGD
0000	8C A6	BSF EECON1, CFGS
Step 2: Set Table Pointer for configuration byte to be written. Write even/odd addresses.(1)		
0000	0E 30	MOVLW 30h
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPRTH
0000	0E 00	MOVLW 00h
0000	6E F6	MOVWF TBLPTRL
1111	<MSB ignored><LSB>	Load 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.
0000	0E 01	MOVLW 01h
0000	6E F6	MOVWF TBLPTRL
1111	<MSB><LSB ignored>	Load 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.

Note 1: Enabling the write protection of Configuration bits (WRTC = 0 in CONFIG6H) will prevent further writing of the Configuration bits. Always write all the Configuration bits before enabling the write protection for Configuration bits.

FIGURE 3-8: CONFIGURATION PROGRAMMING FLOW

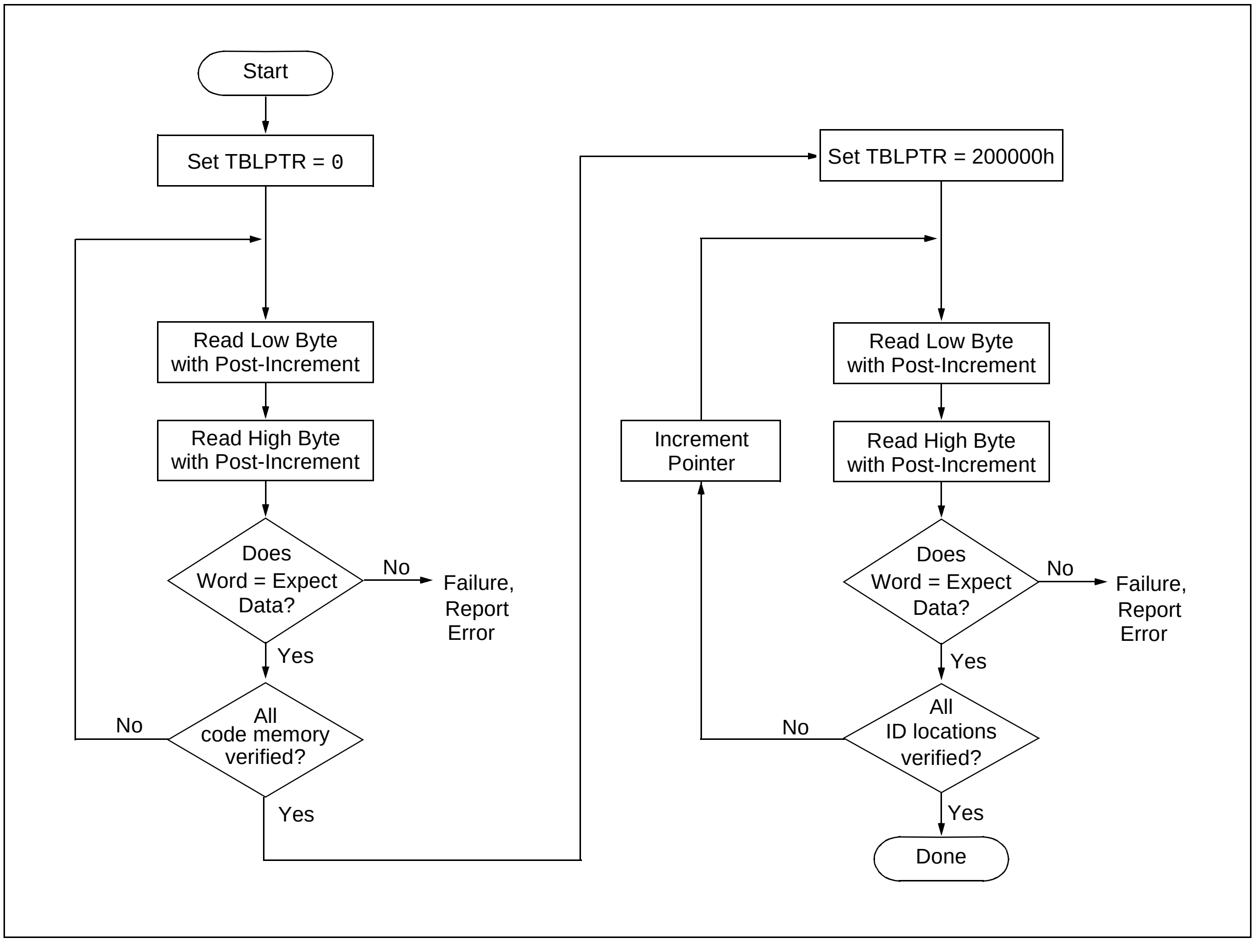


4.2 Verify Code Memory and ID Locations

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading code memory.

The Table Pointer must be manually set to 200000h (base address of the ID locations) once the code memory has been verified. The post-increment feature of the Table Read 4-bit command may not be used to increment the Table Pointer beyond the code memory space. In a 64-Kbyte device, for example, a post-increment read of address, FFFFh, will wrap the Table Pointer back to 000000h, rather than point to the unimplemented address, 010000h.

FIGURE 4-2: VERIFY CODE MEMORY FLOW



4.3 Verify Configuration Bits

A configuration address may be read and output on PGD via the 4-bit command, '1001'. Configuration data is read and written in a byte-wise fashion, so it is not necessary to merge two bytes into a word prior to a compare. The result may then be immediately compared to the appropriate configuration data in the programmer's memory for verification. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading configuration data.

4.4 Read Data EEPROM Memory

Data EEPROM is accessed, one byte at a time, via an Address Pointer (register pair: EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is read by loading EEADRH:EEADR with the desired memory location and initiating a memory read by appropriately configuring the EECON1 register. The data will be loaded into EEDATA, where it may be serially output on PGD via the 4-bit command, '0010' (Shift Out Data Holding register). A delay of P6 must be introduced after the falling edge of the 8th PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-4).

The command sequence to read a single byte of data is shown in Table 4-2.

FIGURE 4-3: READ DATA EEPROM FLOW

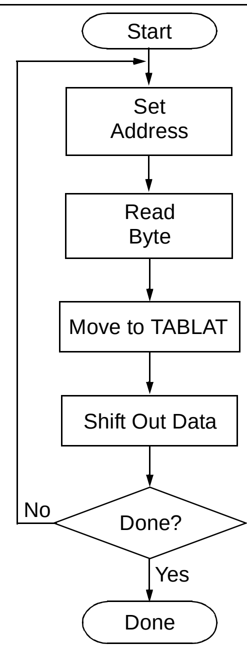


TABLE 4-2: READ DATA EEPROM MEMORY

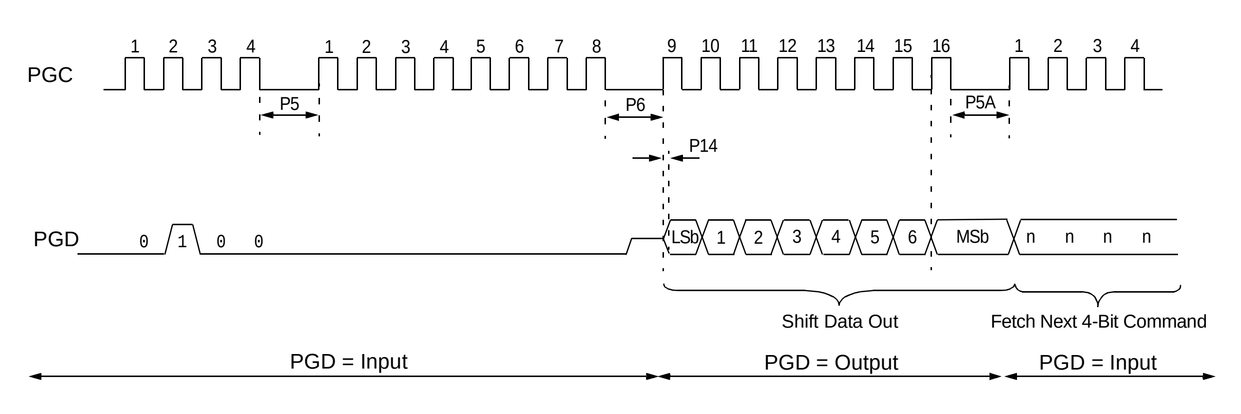
4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to data EEPROM.		
0000 0000	9E A6 9C A6	BCF EECON1, EEPGD BCF EECON1, CFGS
Step 2: Set the data EEPROM Address Pointer.		
0000 0000 0000 0000	0E <Addr> 6E A9 0E <AddrH> 6E AA	MOVLW <Addr> MOVWF EEADR MOVLW <AddrH> MOVWF EEADRH
Step 3: Initiate a memory read.		
0000	80 A6	BSF EECON1, RD
Step 4: Load data into the Serial Data Holding register.		
0000 0000 0000 0010	50 A8 6E F5 00 00 <MSB><LSB>	MOVF EEDATA, W, 0 MOVWF TABLAT NOP Shift Out Data(1)

Note 1: The <LSB> is undefined. The <MSB> is the data.

FIGURE 4-4: SHIFT OUT DATA HOLDING REGISTER TIMING (0010)



4.5 Verify Data EEPROM

A data EEPROM address may be read via a sequence of core instructions (4-bit command, '0000') and then output on PGD via the 4-bit command, '0010' (TABLAT register). The result may then be immediately compared to the appropriate data in the programmer's memory for verification. Refer to **Section 4.4 "Read Data EEPROM Memory"** for implementation details of reading data EEPROM.

4.6 Blank Check

The term Blank Check means to verify that the device has no programmed memory cells. All memories must be verified: code memory, data EEPROM, ID locations and Configuration bits. The Device ID registers (3FFFFEh:3FFFFFh) should be ignored.

A "blank" or "erased" memory cell will read as '1'. Therefore, Blank Checking a device merely means to verify that all bytes read as FFh, except the Configuration bits. Unused (reserved) Configuration bits will read '0' (programmed). Refer to Figure 4-5 for blank configuration expect data for the various PIC18F2XXX/4XXX Family devices.

Given that Blank Checking is merely code and data EEPROM verification with FFh expect data, refer to **Section 4.4 "Read Data EEPROM Memory"** and **Section 4.2 "Verify Code Memory and ID Locations"** for implementation details.

FIGURE 4-5: BLANK CHECK FLOW

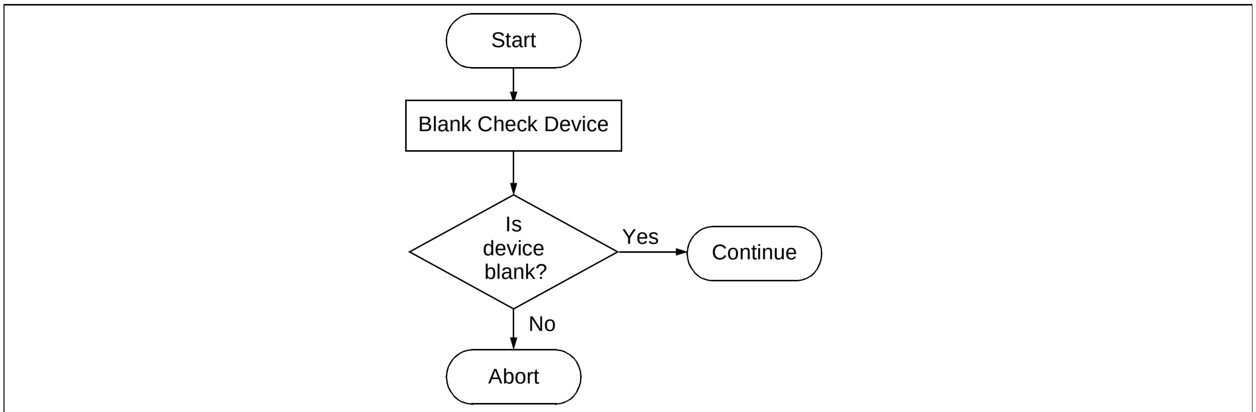


TABLE 5-3: PIC18F2XXX/4XXX FAMILY BIT DESCRIPTIONS

Bit Name	Configuration Words	Description
IESO	CONFIG1H	Internal External Switchover bit 1 = Internal External Switchover mode is enabled 0 = Internal External Switchover mode is disabled

Legend: Shaded cells are unimplemented.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE**.** Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
