What is "**Embedded - Microcontrollers**"?

"**Embedded - Microcontrollers**" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.
Applications of "**Embedded - Microcontrollers**"

Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	40MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	36
Program Memory Size	32KB (16K x 16)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1.5K x 8
Voltage - Supply (Vcc/Vdd)	4.2V ~ 5.5V
Data Converters	A/D 13x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VQFN Exposed Pad
Supplier Device Package	44-QFN (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18f4510t-i-ml

PIC18F2XXX/4XXX FAMILY

The following devices are included in 44-pin TQFP parts:

- PIC18F4221
- PIC18F4321
- PIC18F4410
- PIC18F4420
- PIC18F4423
- PIC18F4450
- PIC18F4455
- PIC18F4458
- PIC18F4480
- PIC18F4510
- PIC18F4520
- PIC18F4515

- PIC18F4523
- PIC18F4525
- PIC18F4550
- PIC18F4553
- PIC18F4580
- PIC18F4585
- PIC18F4610
- PIC18F4620
- PIC18F4680
- PIC18F4682
- PIC18F4685

FIGURE 2-4:   44-PIN TQFP

Note 1: These pins are NC (No Connect) for all devices listed above with the exception of the PIC18F4450, PIC18F4455, PIC18F4458 and the PIC18F4553 devices (see **Section 2.8 "Dedicated ICSP/ICD Port (44-Pin TQFP Only)"** for more information on programming these pins in these devices).

For PIC18F2685/4685 devices, the code memory space extends from 0000h to 017FFFh (96 Kbytes) in five 16-Kbyte blocks. For PIC18F2682/4682 devices, the code memory space extends from 0000h to 0013FFFh (80 Kbytes) in four 16-Kbyte blocks. Addresses, 0000h through 0FFFh, however, define a "Boot Block" region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

The size of the Boot Block in PIC18F2685/4685 and PIC18F2682/4682 devices can be configured as 1, 2 or 4K words (see Figure 2-7). This is done through the BBSIZ<2:1> bits in the Configuration register, CONFIG4L. It is important to note that increasing the size of the Boot Block decreases the size of Block 0.

TABLE 2-3: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2682	000000h-013FFFh (80K)
PIC18F4682	
PIC18F2685	000000h-017FFFh (96K)

FIGURE 2-8: **MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX4X5/X4X8/X5X0/X5X3 DEVICES**

Note: Sizes of memory areas are not to scale.
For PIC18FX4X0/X4X3 devices, the code memory space extends from 000000h to 003FFFh (16 Kbytes) in two 8-Kbyte blocks. Addresses, 000000h through 0003FFh, however, define a "Boot Block" region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

2.5 Entering and Exiting High-Voltage ICSP Program/Verify Mode

As shown in Figure 2-14, the High-Voltage ICSP Program/Verify mode is entered by holding PGC and PGD low and then raising MCLR/VPP/RE3 to VIHH (high voltage). Once in this mode, the code memory, data EEPROM (selected devices only, see **Section 3.3 "Data EEPROM Programming"**), ID locations and Configuration bits can be accessed and programmed in serial fashion. Figure 2-15 shows the exit sequence.

The sequence that enters the device into the Program/Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-14:   **ENTERING HIGH-VOLTAGE PROGRAM/VERIFY MODE**

FIGURE 2-15:   **EXITING HIGH-VOLTAGE PROGRAM/VERIFY MODE**

2.7   Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.7.1   4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-8.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-9. The 4-bit command is shown Most Significant bit (MSb) first. The command operand, or "Data Payload", is shown as <MSB><LSB>. Figure 2-18 demonstrates how to serially present a 20-bit command/operand to the device.

2.7.2   CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to set up registers as appropriate for use with other commands.

TABLE 2-8:   COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in16-bit instruction)	0000
Shift Out TABLAT Register	0010

FIGURE 2-18: **TABLE WRITE, POST-INCREMENT TIMING (**`1101`**)**
2.8 Dedicated ICSP/ICD Port (44-Pin TQFP Only)

The PIC18F4455/4458/4550/4553 44-pin TQFP devices are designed to support an alternate programming input: the dedicated ICSP/ICD port. The primary purpose of this port is to provide an alternate In-Circuit Debugging (ICD) option and free the pins (RB6, RB7 and $\overline{MCLR}$) that would normally be used for debugging the application. In conjunction with ICD capability, however, the dedicated ICSP/ICD port also provides an alternate port for ICSP.

Setting the ICPRT Configuration bit enables the dedicated ICSP/ICD port. The dedicated ICSP/ICD port functions the same as the default ICSP/ICD port; however, alternate pins are used instead of the default pins. Table 2-10 identifies the functionally equivalent pins for ICSP purposes:

The dedicated ICSP/ICD port is an alternate port. Thus, ICSP is still available through the default port even though the ICPRT Configuration bit is set. When the V_{IH} is seen on the $\overline{MCLR}$/VPP/RE3 pin prior to applying V_{IH} to the ICRST/ICVPP pin, then the state of the ICRST/ICVPP pin is ignored. Likewise, when the V_{IH} is seen on ICRST/ICVPP prior to applying V_{IH} to $\overline{MCLR}$/VPP/RE3, then the state of the $\overline{MCLR}$/VPP/RE3 pin is ignored.

Note:	The ICPRT Configuration bit can only be programmed through the default ICSP port. Chip Erase functions through the dedicated ICSP/ICD port do not affect this bit.
	When the ICPRT Configuration bit is set (dedicated ICSP/ICD port enabled), the NC/ICPORTS pin must be tied to either VDD or VSS.
	The ICPRT Configuration bit must be maintained clear for all 28-pin and 40-pin devices; otherwise, unexpected operation may occur.

TABLE 2-10: **ICSP™ EQUIVALENT PINS**

Pin Name	During Programming			
	Pin Name	**Pin Type**	**Dedicated Pins**	**Pin Description**
$\overline{MCLR}$/VPP/RE3	VPP	P	NC/ICRST/ICVPP	Programming Enable
RB6	PGC	I	NC/ICCK/ICPGC	Serial Clock
RB7	PGD	I/O	NC/ICDT/ICPGD	Serial Data

Legend: I = Input, O = Output, P = Power

3.0   DEVICE PROGRAMMING

Programming includes the ability to erase or write the various memory regions within the device.

In all cases, except high-voltage ICSP Bulk Erase, the EECON1 register must be configured in order to operate on a particular memory region.

When using the EECON1 register to act on code memory, the EEPGD bit must be set (EECON1<7> = 1) and the CFGS bit must be cleared (EECON1<6> = 0). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort (e.g., erases) and this must be done prior to initiating a write sequence. The FREE bit must be set (EECON1<4> = 1) in order to erase the program space being pointed to by the Table Pointer. The erase or write sequence is initiated by setting the WR bit (EECON1<1> = 1). It is strongly recommended that the WREN bit only be set immediately prior to a program erase.

3.1   ICSP Erase

3.1.1   HIGH-VOLTAGE ICSP BULK ERASE

Erasing code or data EEPROM is accomplished by configuring two Bulk Erase Control registers located at 3C0004h and 3C0005h. Code memory may be erased, portions at a time, or the user may erase the entire device in one action. Bulk Erase operations will also clear any code-protect settings associated with the memory block being erased. Erase options are detailed in Table 3-1. If data EEPROM is code-protected (CPD = 0), the user must request an erase of data EEPROM (e.g., 0084h as shown in Table 3-1).

TABLE 3-1:   BULK ERASE OPTIONS

Description	Data (3C0005h:3C0004h)
Chip Erase	3F8Fh
Erase Data EEPROM[(1)]	0084h
Erase Boot Block	0081h
Erase Configuration Bits	0082h
Erase Code EEPROM Block 0	0180h
Erase Code EEPROM Block 1	0280h
Erase Code EEPROM Block 2	0480h
Erase Code EEPROM Block 3	0880h
Erase Code EEPROM Block 4	1080h
Erase Code EEPROM Block 5	2080h

Note 1:   Selected devices only, see **Section 3.3 "Data EEPROM Programming"**.

The actual Bulk Erase function is a self-timed operation. Once the erase has started (falling edge of the 4th PGC after the NOP command), serial execution will cease until the erase completes (Parameter P11). During this time, PGC may continue to toggle but PGD must be held low.

The code sequence to erase the entire device is shown in Table and the flowchart is shown in Figure 3-1.

> **Note:**   A Bulk Erase is the only way to reprogram code-protect bits from an ON state to an OFF state.

colspan	Repeat Steps 2 through 8 to write more data.	

Note 1: See Figure 4-4 for details on shift out data timing.

3.4 ID Location Programming

The ID locations are programmed much like the code memory. The ID registers are mapped in addresses, 200000h through 200007h. These locations read out normally even after code protection.

Note: The user only needs to fill the first 8 bytes of the write buffer in order to write the ID locations.

Table 3-8 demonstrates the code sequence required to write the ID locations.

In order to modify the ID locations, refer to the methodology described in **Section 3.2.1 "Modifying Code Memory"**. As with code memory, the ID locations must be erased before being modified.

TABLE 3-8: WRITE ID SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory and enable writes.		
0000	8E A6	BSF EECON1, EEPGD
0000	9C A6	BCF EECON1, CFGS
Step 2: Load write buffer with 8 bytes and write.		
0000	0E 20	MOVLW 20h
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 00	MOVLW 00h
0000	6E F6	MOVWF TBLPTRL
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
1111	<MSB><LSB>	Write 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.

3.5 Boot Block Programming

The code sequence detailed in Table 3-5 should be used, except that the address used in "Step 2" will be in the range of 000000h to 0007FFh.

3.6 Configuration Bits Programming

Unlike code memory, the Configuration bits are programmed a byte at a time. The Table Write, Begin Programming 4-bit command ('1111') is used, but only eight bits of the following 16-bit payload will be written. The LSB of the payload will be written to even addresses and the MSB will be written to odd addresses. The code sequence to program two consecutive configuration locations is shown in Table 3-9.

Note: The address must be explicitly written for each byte programmed. The addresses can not be incremented in this mode.

TABLE 3-9: **SET ADDRESS POINTER TO CONFIGURATION LOCATION**

4-Bit Command	Data Payload	Core Instruction
Step 1: Enable writes and direct access to configuration memory.		
0000	8E A6	BSF EECON1, EEPGD
0000	8C A6	BSF EECON1, CFGS
Step 2: Set Table Pointer for configuration byte to be written. Write even/odd addresses.[1]		
0000	0E 30	MOVLW 30h
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPRTH
0000	0E 00	MOVLW 00h
0000	6E F6	MOVWF TBLPTRL
1111	<MSB ignored><LSB>	Load 2 bytes and start programming.
0000	00 00	NOP – hold PGC high for time P9 and low for time P10.
0000	0E 01	MOVLW 01h
0000	6E F6	MOVWF TBLPTRL
1111	<MSB><LSB ignored>	Load 2 bytes and start programming.
0000	00 00	NOP – hold PGC high for time P9 and low for time P10.

Note 1: Enabling the write protection of Configuration bits (WRTC = 0 in CONFIG6H) will prevent further writing of the Configuration bits. Always write all the Configuration bits before enabling the write protection for Configuration bits.

LPT1OSC	CONFIG3H	Low-Power Timer1 Oscillator Enable bit `1` = Timer1 is configured for low-power operation `0` = Timer1 is configured for high-power operation
PBADEN	CONFIG3H	PORTB A/D Enable bit `1` = PORTB A/D<4:0> pins are configured as analog input channels on Reset `0` = PORTB A/D<4:0> pins are configured as digital I/O on Reset
PBADEN	CONFIG3H	PORTB A/D Enable bit **(PIC18FXX8X devices only)** `1` = PORTB A/D<4:0> and PORTB A/D<1:0> pins are configured as analog input channels on Reset `0` = PORTB A/D<4:0> pins are configured as digital I/O on Reset
CCP2MX	CONFIG3H	CCP2 MUX bit `1` = CCP2 input/output is multiplexed with RC1[2] `0` = CCP2 input/output is multiplexed with RB3
$\overline{\text{DEBUG}}$	CONFIG4L	Background Debugger Enable bit `1` = Background debugger is disabled, RB6 and RB7 are configured as general purpose I/O pins `0` = Background debugger is enabled, RB6 and RB7 are dedicated to In-Circuit Debug
XINST	CONFIG4L	Extended Instruction Set Enable bit `1` = Instruction set extension and Indexed Addressing mode are enabled `0` = Instruction set extension and Indexed Addressing mode are disabled (Legacy mode)
ICPRT	CONFIG4L	Dedicated In-Circuit (ICD/ICSP™) Port Enable bit **(PIC18F2455/2550/4455/4550, PIC18F2458/2553/4458/4553 and PIC18F2450/4450 devices only)** `1` = ICPORT is enabled `0` = ICPORT is disabled
BBSIZ<1:0>[1]	CONFIG4L	Boot Block Size Select bits **(PIC18F2585/2680/4585/4680 devices only)** `11` = 4K words (8 Kbytes) Boot Block `10` = 4K words (8 Kbytes) Boot Block `01` = 2K words (4 Kbytes) Boot Block `00` = 1K word (2 Kbytes) Boot Block
BBSIZ<2:1>[1]	CONFIG4L	Boot Block Size Select bits **(PIC18F2682/2685/4582/4685 devices only)** `11` = 4K words (8 Kbytes) Boot Block `10` = 4K words (8 Kbytes) Boot Block `01` = 2K words (4 Kbytes) Boot Block `00` = 1K word (2 Kbytes) Boot Block

Note 1: The BBSIZ bits, BBSIZ<1:0> and BBSIZ<2:1> bits, cannot be changed once any of the following code-protect bits are enabled: CPB or CP0, WRTB or WRT0, EBTRB or EBTR0.

2: Not available in PIC18FXX8X and PIC18F2450/4450 devices.

TABLE 5-3:   PIC18F2XXX/4XXX FAMILY BIT DESCRIPTIONS (CONTINUED)

Bit Name	Configuration Words	Description
WRT5	CONFIG6L	Write Protection bit (Block 5 code memory area) **(PIC18F2685 and PIC18F4685 devices only)** 1 = Block 5 is not write-protected 0 = Block 5 is write-protected
WRT4	CONFIG6L	Write Protection bit (Block 4 code memory area) **(PIC18F2682/2685 and PIC18F4682/4685 devices only)** 1 = Block 4 is not write-protected 0 = Block 4 is write-protected
WRT3	CONFIG6L	Write Protection bit (Block 3 code memory area) 1 = Block 3 is not write-protected 0 = Block 3 is write-protected
WRT2	CONFIG6L	Write Protection bit (Block 2 code memory area) 1 = Block 2 is not write-protected 0 = Block 2 is write-protected
WRT1	CONFIG6L	Write Protection bit (Block 1 code memory area) 1 = Block 1 is not write-protected 0 = Block 1 is write-protected
WRT0	CONFIG6L	Write Protection bit (Block 0 code memory area) 1 = Block 0 is not write-protected 0 = Block 0 is write-protected
WRTD	CONFIG6H	Write Protection bit (Data EEPROM) 1 = Data EEPROM is not write-protected 0 = Data EEPROM is write-protected
WRTB	CONFIG6H	Write Protection bit (Boot Block memory area) 1 = Boot Block is not write-protected 0 = Boot Block is write-protected
WRTC	CONFIG6H	Write Protection bit (Configuration registers) 1 = Configuration registers are not write-protected 0 = Configuration registers are write-protected
EBTR5	CONFIG7L	Table Read Protection bit (Block 5 code memory area) **(PIC18F2685 and PIC18F4685 devices only)** 1 = Block 5 is not protected from Table Reads executed in other blocks 0 = Block 5 is protected from Table Reads executed in other blocks
EBTR4	CONFIG7L	Table Read Protection bit (Block 4 code memory area) **(PIC18F2682/2685 and PIC18F4682/4685 devices only)** 1 = Block 4 is not protected from Table Reads executed in other blocks 0 = Block 4 is protected from Table Reads executed in other blocks
EBTR3	CONFIG7L	Table Read Protection bit (Block 3 code memory area) 1 = Block 3 is not protected from Table Reads executed in other blocks 0 = Block 3 is protected from Table Reads executed in other blocks
EBTR2	CONFIG7L	Table Read Protection bit (Block 2 code memory area) 1 = Block 2 is not protected from Table Reads executed in other blocks 0 = Block 2 is protected from Table Reads executed in other blocks
EBTR1	CONFIG7L	Table Read Protection bit (Block 1 code memory area) 1 = Block 1 is not protected from Table Reads executed in other blocks 0 = Block 1 is protected from Table Reads executed in other blocks

Note 1: The BBSIZ bits, BBSIZ<1:0> and BBSIZ<2:1> bits, cannot be changed once any of the following code-protect bits are enabled: CPB or CP0, WRTB or WRT0, EBTRB or EBTR0.

2: Not available in PIC18FXX8X and PIC18F2450/4450 devices.

TABLE 5-3: PIC18F2XXX/4XXX FAMILY BIT DESCRIPTIONS (CONTINUED)

Bit Name	Configuration Words	Description
EBTR0	CONFIG7L	Table Read Protection bit (Block 0 code memory area) `1` = Block 0 is not protected from Table Reads executed in other blocks `0` = Block 0 is protected from Table Reads executed in other blocks
EBTRB	CONFIG7H	Table Read Protection bit (Boot Block memory area) `1` = Boot Block is not protected from Table Reads executed in other blocks `0` = Boot Block is protected from Table Reads executed in other blocks
DEV<10:3>	DEVID2	Device ID bits These bits are used with the DEV<2:0> bits in the DEVID1 register to identify part number.
DEV<2:0>	DEVID1	Device ID bits These bits are used with the DEV<10:3> bits in the DEVID2 register to identify part number.
REV<4:0>	DEVID1	Revision ID bits These bits are used to indicate the revision of the device. The REV4 bit is sometimes used to fully specify the device type.

Note 1: The BBSIZ bits, BBSIZ<1:0> and BBSIZ<2:1> bits, cannot be changed once any of the following code-protect bits are enabled: CPB or CP0, WRTB or WRT0, EBTRB or EBTR0.

2: Not available in PIC18FXX8X and PIC18F2450/4450 devices.

TABLE 5-4: DEVICE BLOCK LOCATIONS AND SIZES (CONTINUED)

Device	Memory Size (Bytes)	Pins	Ending Address							Size (Bytes)			
			Boot Block	Block 0	Block 1	Block 2	Block 3	Block 4	Block 5	Boot Block	Block 0	Remaining Blocks	Device Total
