
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	40MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	25
Program Memory Size	48KB (24K x 16)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	3.8K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5.5V
Data Converters	A/D 10x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18lf2515-i-so

TABLE 2-1: PIN DESCRIPTIONS (DURING PROGRAMMING): PIC18F2XXX/4XXX FAMILY

Pin Name	During Programming		
	Pin Name	Pin Type	Pin Description
$\overline{MCLR}$/VPP/RE3	VPP	P	Programming Enable
VDD(2)	VDD	P	Power Supply
VSS(2)	VSS	P	Ground
RB5	PGM	I	Low-Voltage ICSP™ Input when LVP Configuration bit equals '1'(1)
RB6	PGC	I	Serial Clock
RB7	PGD	I/O	Serial Data

Legend: I = Input, O = Output, P = Power
Note 1: See Figure 5-1 for more information.
2: All power supply (VDD) and ground (VSS) pins must be connected.

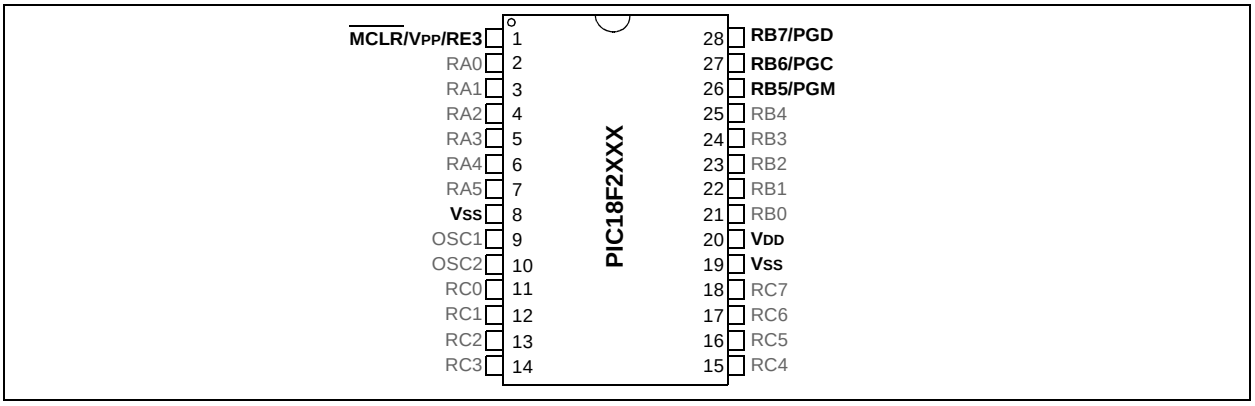
The following devices are included in 28-pin SPDIP, PDIP and SOIC parts:

- PIC18F2221
- PIC18F2321
- PIC18F2410
- PIC18F2420
- PIC18F2423
- PIC18F2450
- PIC18F2455
- PIC18F2458
- PIC18F2480
- PIC18F2510
- PIC18F2515
- PIC18F2520
- PIC18F2523
- PIC18F2525
- PIC18F2550
- PIC18F2553
- PIC18F2580
- PIC18F2585
- PIC18F2610
- PIC18F2620
- PIC18F2680
- PIC18F2682
- PIC18F2685

The following devices are included in 28-pin SSOP parts:

- PIC18F2221
- PIC18F2321

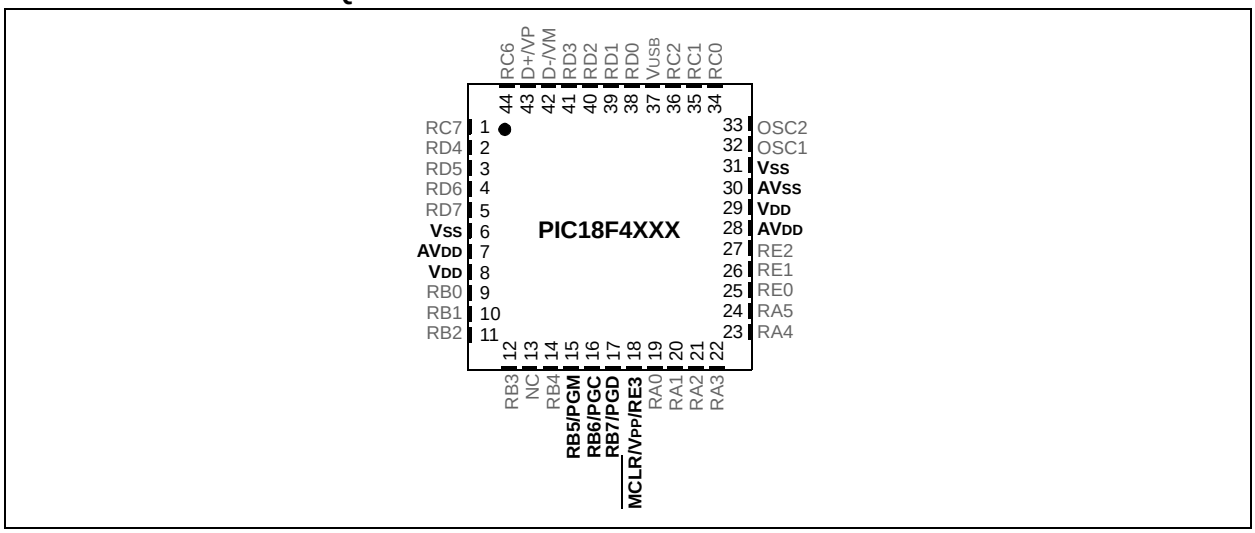
FIGURE 2-1: 28-Pin SPDIP, PDIP, SOIC,SSOP



The following devices are included in 44-pin QFN parts:

- PIC18F4221
- PIC18F4321
- PIC18F4410
- PIC18F4420
- PIC18F4423
- PIC18F4450
- PIC18F4455
- PIC18F4458
- PIC18F4480
- PIC18F4510
- PIC18F4520
- PIC18F4515
- PIC18F4523
- PIC18F4525
- PIC18F4550
- PIC18F4553
- PIC18F4580
- PIC18F4585
- PIC18F4610
- PIC18F4620
- PIC18F4680
- PIC18F4682
- PIC18F4685

FIGURE 2-5: 44-PIN QFN



2.3 Memory Maps

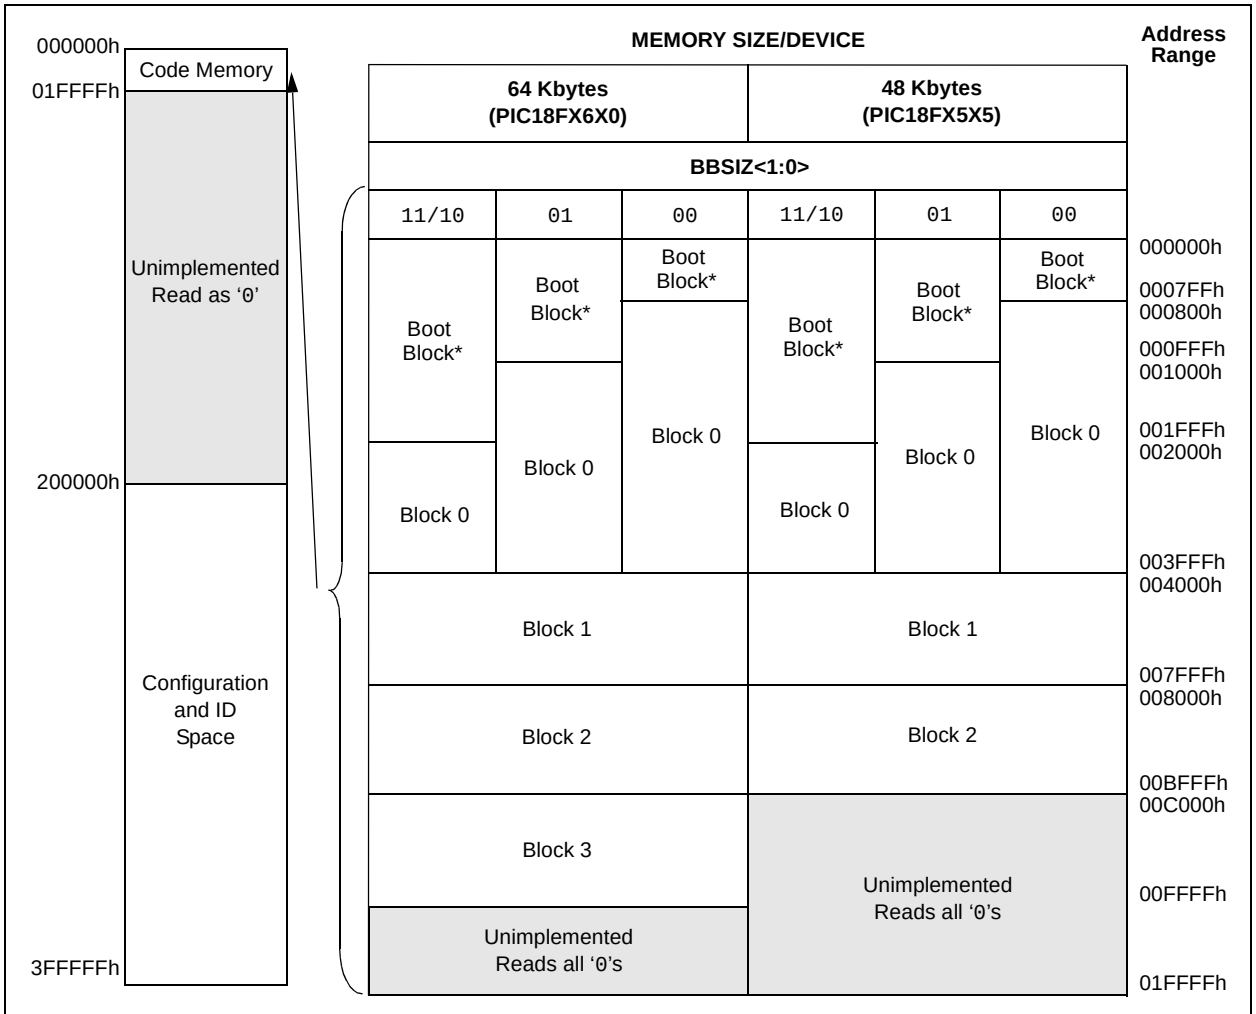
For PIC18FX6X0 devices, the code memory space extends from 0000h to 0FFFFh (64 Kbytes) in four 16-Kbyte blocks. For PIC18FX5X5 devices, the code memory space extends from 0000h to 0BFFFFh (48 Kbytes) in three 16-Kbyte blocks. Addresses, 0000h through 07FFh, however, define a “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

The size of the Boot Block in PIC18F2585/2680/4585/4680 devices can be configured as 1, 2 or 4K words (see Figure 2-6). This is done through the BBSIZ<1:0> bits in the Configuration register, CONFIG4L. It is important to note that increasing the size of the Boot Block decreases the size of Block 0.

TABLE 2-2: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2515	000000h-00BFFFh (48K)
PIC18F2525	
PIC18F2585	
PIC18F4515	
PIC18F4525	
PIC18F4585	
PIC18F2610	000000h-00FFFFh (64K)
PIC18F2620	
PIC18F2680	
PIC18F4610	
PIC18F4620	
PIC18F4680	

FIGURE 2-6: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX5X5/X6X0 DEVICES



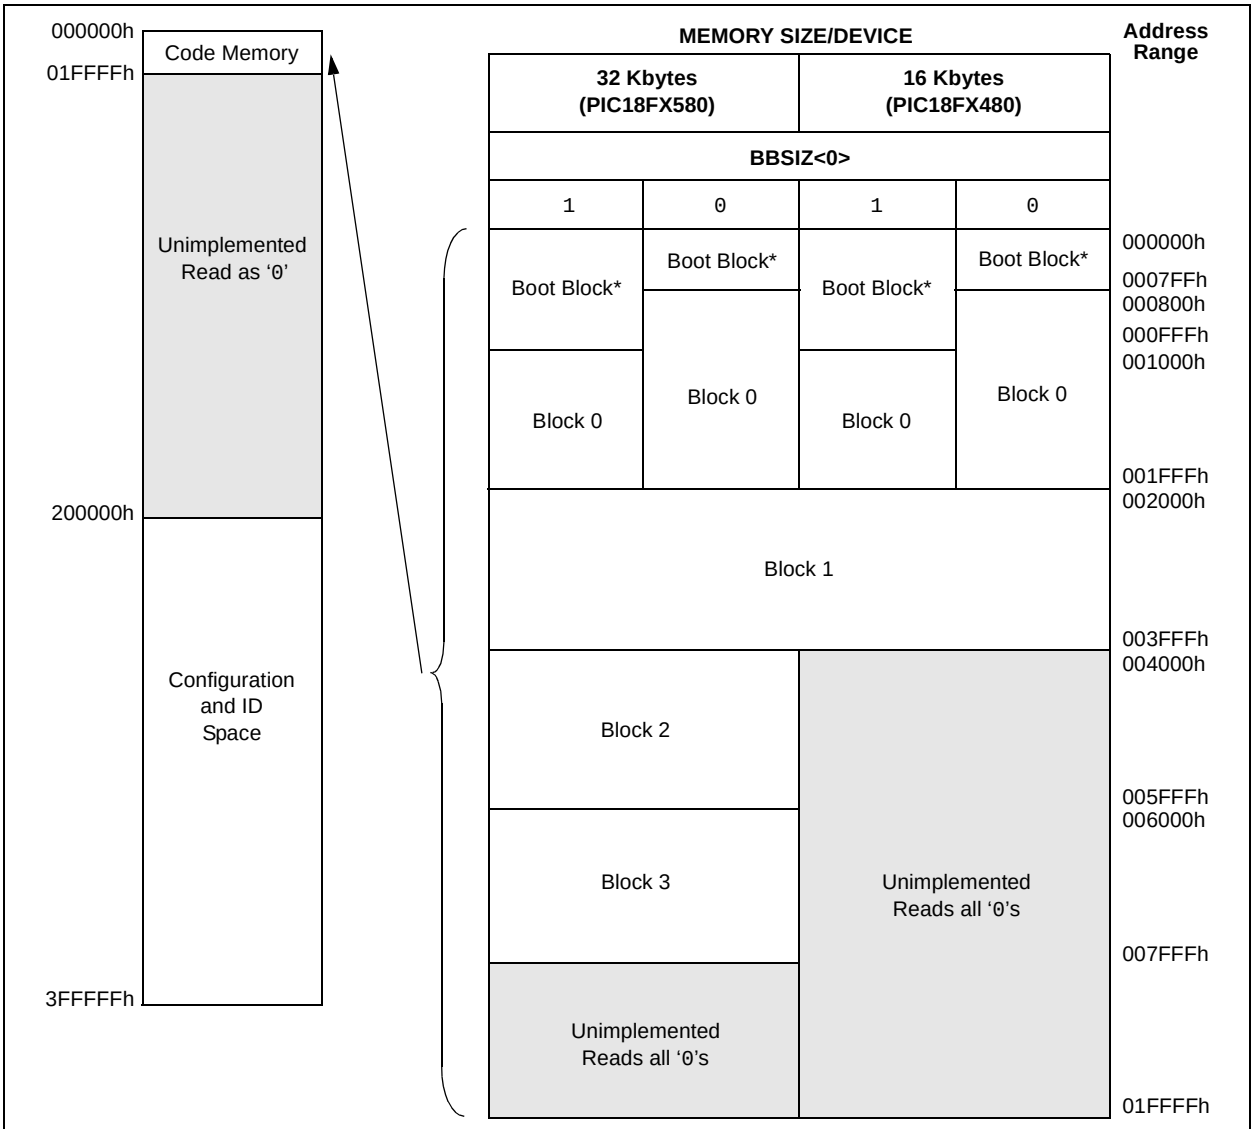
Note: Sizes of memory areas are not to scale.

* Boot Block size is determined by the BBSIZ<1:0> bits in the CONFIG4L register.

TABLE 2-6: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2480	000000h-003FFFh (16K)
PIC18F4480	
PIC18F2580	000000h-007FFFh (32K)
PIC18F4580	

FIGURE 2-10: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18F2480/2580/4480/4580 DEVICES



Note: Sizes of memory areas are not to scale.

* Boot Block size is determined by the BBSIZ<0> bit in the CONFIG4L register.

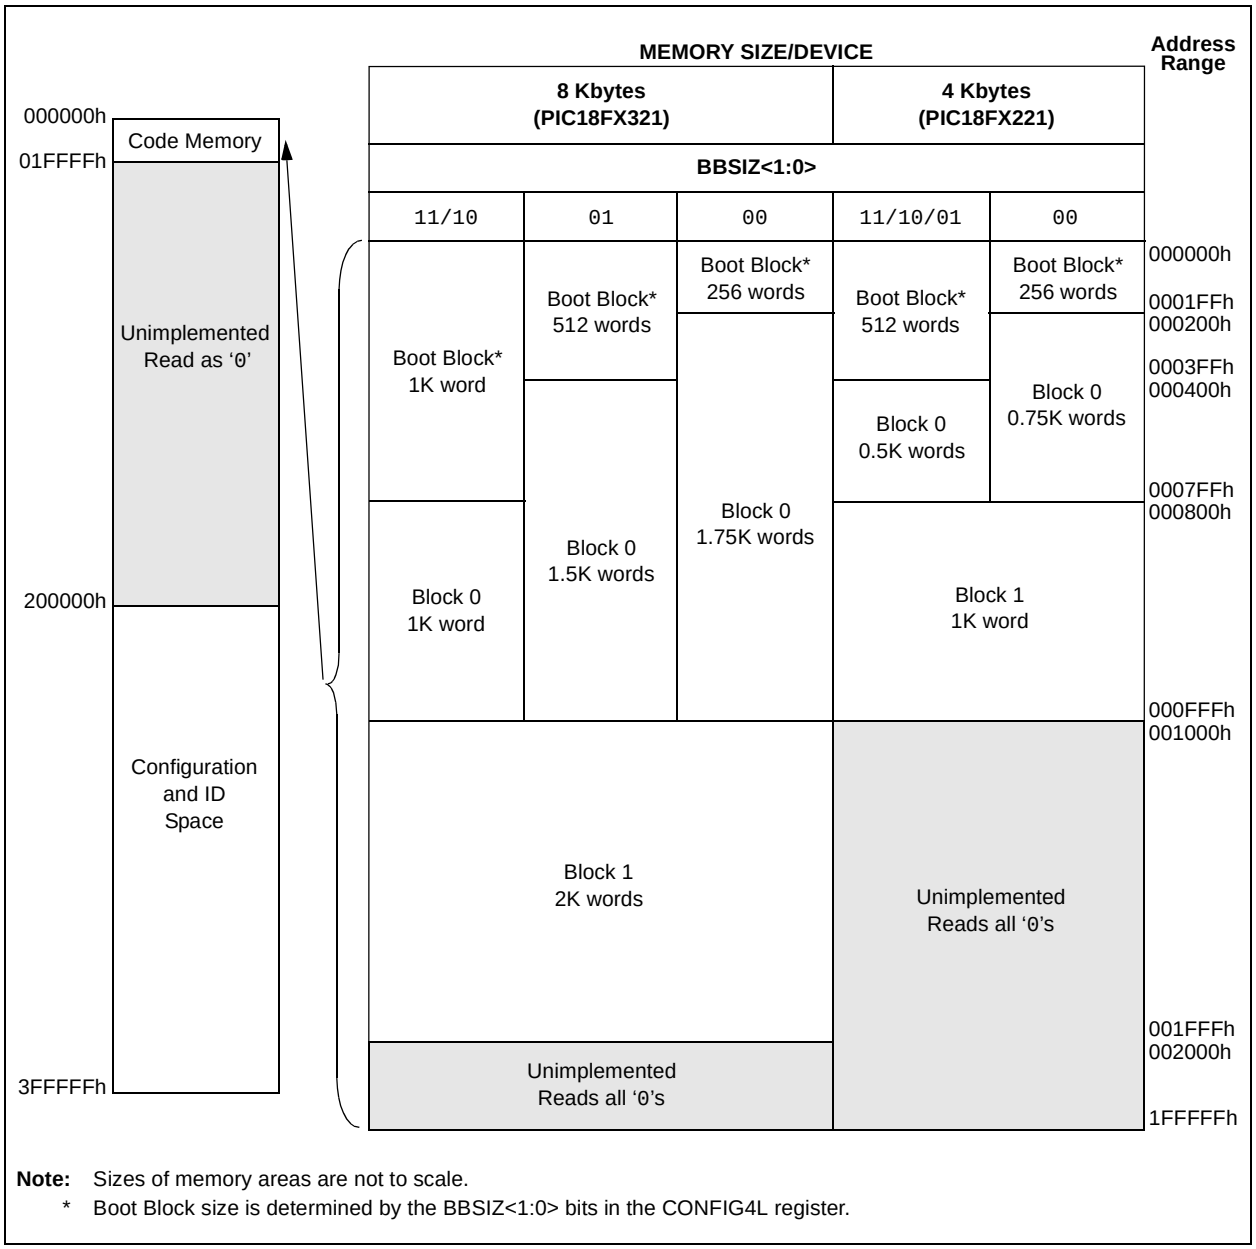
For PIC18F2221/4221 devices, the code memory space extends from 0000h to 00FFFh (4 Kbytes) in one 4-Kbyte block. For PIC18F2321/4321 devices, the code memory space extends from 0000h to 01FFFh (8 Kbytes) in two 4-Kbyte blocks. Addresses, 0000h through 07FFh, however, define a variable “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

The size of the Boot Block in PIC18F2221/2321/4221/4321 devices can be configured as 256, 512 or 1024 words (see Figure 2-11). This is done through the BBSIZ<1:0> bits in the Configuration register, CONFIG4L (see Figure 2-11). It is important to note that increasing the size of the Boot Block decreases the size of Block 0.

TABLE 2-7: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2221	000000h-000FFFh (4K)
PIC18F4221	
PIC18F2321	000000h-001FFFh (8K)
PIC18F4321	

FIGURE 2-11: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18F2221/2321/4221/4321 DEVICES



Note: Sizes of memory areas are not to scale.

* Boot Block size is determined by the BBSIZ<1:0> bits in the CONFIG4L register.

In addition to the code memory space, there are three blocks that are accessible to the user through Table Reads and Table Writes. Their locations in the memory map are shown in Figure 2-12.

Users may store identification information (ID) in eight ID registers. These ID registers are mapped in addresses, 200000h through 200007h. The ID locations read out normally, even after code protection is applied.

Locations, 300000h through 30000Dh, are reserved for the Configuration bits. These bits select various device options and are described in **Section 5.0 "Configuration Word"**. These Configuration bits read out normally, even after code protection.

Locations, 3FFFFEh and 3FFFFFh, are reserved for the Device ID bits. These bits may be used by the programmer to identify what device type is being programmed and are described in **Section 5.0 "Configuration Word"**. These Device ID bits read out normally, even after code protection.

2.3.1 MEMORY ADDRESS POINTER

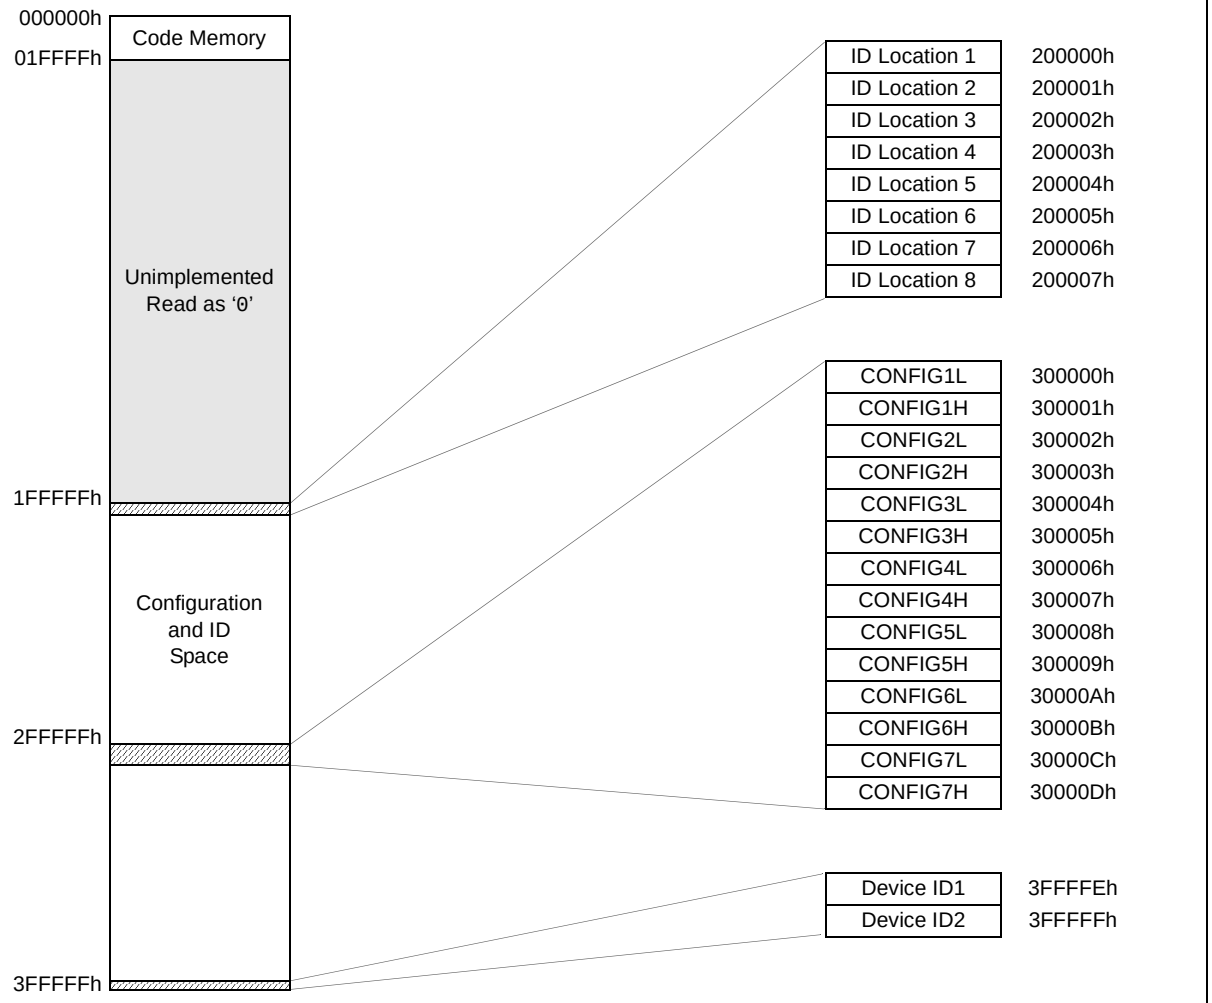
Memory in the address space, 0000000h to 3FFFFFh, is addressed via the Table Pointer register, which is comprised of three pointer registers:

- TBLPTRU at RAM address 0FF8h
- TBLPTRH at RAM address 0FF7h
- TBLPTRL at RAM address 0FF6h

TBLPTRU	TBLPTRH	TBLPTRL
Addr[21:16]	Addr[15:8]	Addr[7:0]

The 4-bit command, '0000' (core instruction), is used to load the Table Pointer prior to using many read or write operations.

FIGURE 2-12: CONFIGURATION AND ID LOCATIONS FOR PIC18F2XXX/4XXX FAMILY DEVICES



Note: Sizes of memory areas are not to scale.

2.5 Entering and Exiting High-Voltage ICSP Program/Verify Mode

As shown in Figure 2-14, the High-Voltage ICSP Program/Verify mode is entered by holding PGC and PGD low and then raising $\overline{MCLR}$/VPP/RE3 to VIHH (high voltage). Once in this mode, the code memory, data EEPROM (selected devices only, see **Section 3.3 "Data EEPROM Programming"**), ID locations and Configuration bits can be accessed and programmed in serial fashion. Figure 2-15 shows the exit sequence.

The sequence that enters the device into the Program/Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-14: ENTERING HIGH-VOLTAGE PROGRAM/VERIFY MODE

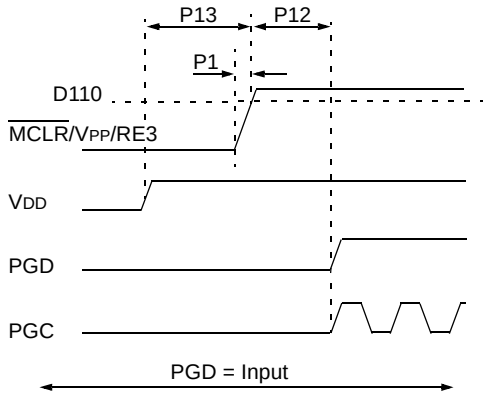


FIGURE 2-15: EXITING HIGH-VOLTAGE PROGRAM/VERIFY MODE

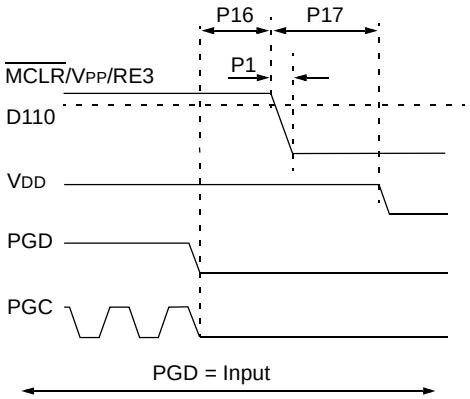


2.7 Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.7.1 4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-8.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-9. The 4-bit command is shown Most Significant bit (MSb) first. The command operand, or “Data Payload”, is shown as <MSB><LSB>. Figure 2-18 demonstrates how to serially present a 20-bit command/operand to the device.

2.7.2 CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to set up registers as appropriate for use with other commands.

TABLE 2-8: COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in16-bit instruction)	0000
Shift Out TABLAT Register	0010
Table Read	1000
Table Read, Post-Increment	1001
Table Read, Post-Decrement	1010
Table Read, Pre-Increment	1011
Table Write	1100
Table Write, Post-Increment by 2	1101
Table Write, Start Programming, Post-Increment by 2	1110
Table Write, Start Programming	1111

TABLE 2-9: SAMPLE COMMAND SEQUENCE

4-Bit Command	Data Payload	Core Instruction
1101	3C 40	Table Write, post-increment by 2

3.0 DEVICE PROGRAMMING

Programming includes the ability to erase or write the various memory regions within the device.

In all cases, except high-voltage ICSP Bulk Erase, the EECON1 register must be configured in order to operate on a particular memory region.

When using the EECON1 register to act on code memory, the EEPGD bit must be set (EECON1<7> = 1) and the CFGS bit must be cleared (EECON1<6> = 0). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort (e.g., erases) and this must be done prior to initiating a write sequence. The FREE bit must be set (EECON1<4> = 1) in order to erase the program space being pointed to by the Table Pointer. The erase or write sequence is initiated by setting the WR bit (EECON1<1> = 1). It is strongly recommended that the WREN bit only be set immediately prior to a program erase.

3.1 ICSP Erase

3.1.1 HIGH-VOLTAGE ICSP BULK ERASE

Erasing code or data EEPROM is accomplished by configuring two Bulk Erase Control registers located at 3C0004h and 3C0005h. Code memory may be erased, portions at a time, or the user may erase the entire device in one action. Bulk Erase operations will also clear any code-protect settings associated with the memory block being erased. Erase options are detailed in Table 3-1. If data EEPROM is code-protected (CPD = 0), the user must request an erase of data EEPROM (e.g., 0084h as shown in Table 3-1).

TABLE 3-1: BULK ERASE OPTIONS

Description	Data (3C0005h:3C0004h)
Chip Erase	3F8Fh
Erase Data EEPROM(1)	0084h
Erase Boot Block	0081h
Erase Configuration Bits	0082h
Erase Code EEPROM Block 0	0180h
Erase Code EEPROM Block 1	0280h
Erase Code EEPROM Block 2	0480h
Erase Code EEPROM Block 3	0880h
Erase Code EEPROM Block 4	1080h
Erase Code EEPROM Block 5	2080h

Note 1: Selected devices only, see **Section 3.3 “Data EEPROM Programming”**.

The actual Bulk Erase function is a self-timed operation. Once the erase has started (falling edge of the 4th PGC after the NOP command), serial execution will cease until the erase completes (Parameter P11). During this time, PGC may continue to toggle but PGD must be held low.

The code sequence to erase the entire device is shown in Table and the flowchart is shown in Figure 3-1.

Note: A Bulk Erase is the only way to reprogram code-protect bits from an ON state to an OFF state.

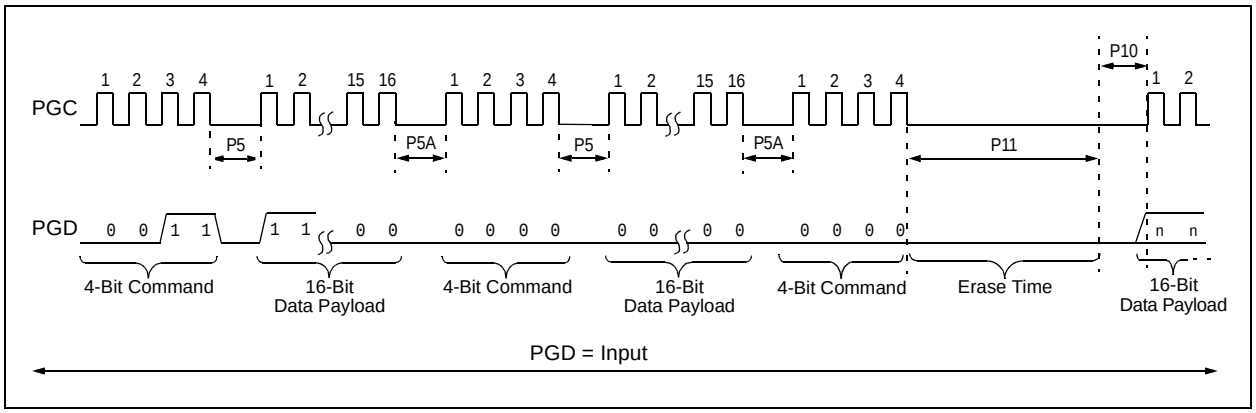
3.1.2 LOW-VOLTAGE ICSP BULK ERASE

When using low-voltage ICSP, the part must be supplied by the voltage specified in Parameter D111 if a Bulk Erase is to be executed. All other Bulk Erase details, as described above, apply.

If it is determined that a program memory erase must be performed at a supply voltage below the Bulk Erase limit, refer to the erase methodology described in **Section 3.1.3 "ICSP Row Erase"** and **Section 3.2.1 "Modifying Code Memory"**.

If it is determined that a data EEPROM erase (selected devices only, see **Section 3.3 "Data EEPROM Programming"**) must be performed at a supply voltage below the Bulk Erase limit, follow the methodology described in **Section 3.3 "Data EEPROM Programming"** and write '1's to the array.

FIGURE 3-2: BULK ERASE TIMING



3.1.3 ICSP ROW ERASE

Regardless of whether high or low-voltage ICSP is used, it is possible to erase one row (64 bytes of data), provided the block is not code or write-protected. Rows are located at static boundaries, beginning at program memory address, 000000h, extending to the internal program memory limit (see **Section 2.3 "Memory Maps"**).

The Row Erase duration is externally timed and is controlled by PGC. After the WR bit in EECON1 is set, a NOP is issued, where the 4th PGC is held high for the duration of the programming time, P9.

After PGC is brought low, the programming sequence is terminated. PGC must be held low for the time specified by Parameter P10 to allow high-voltage discharge of the memory array.

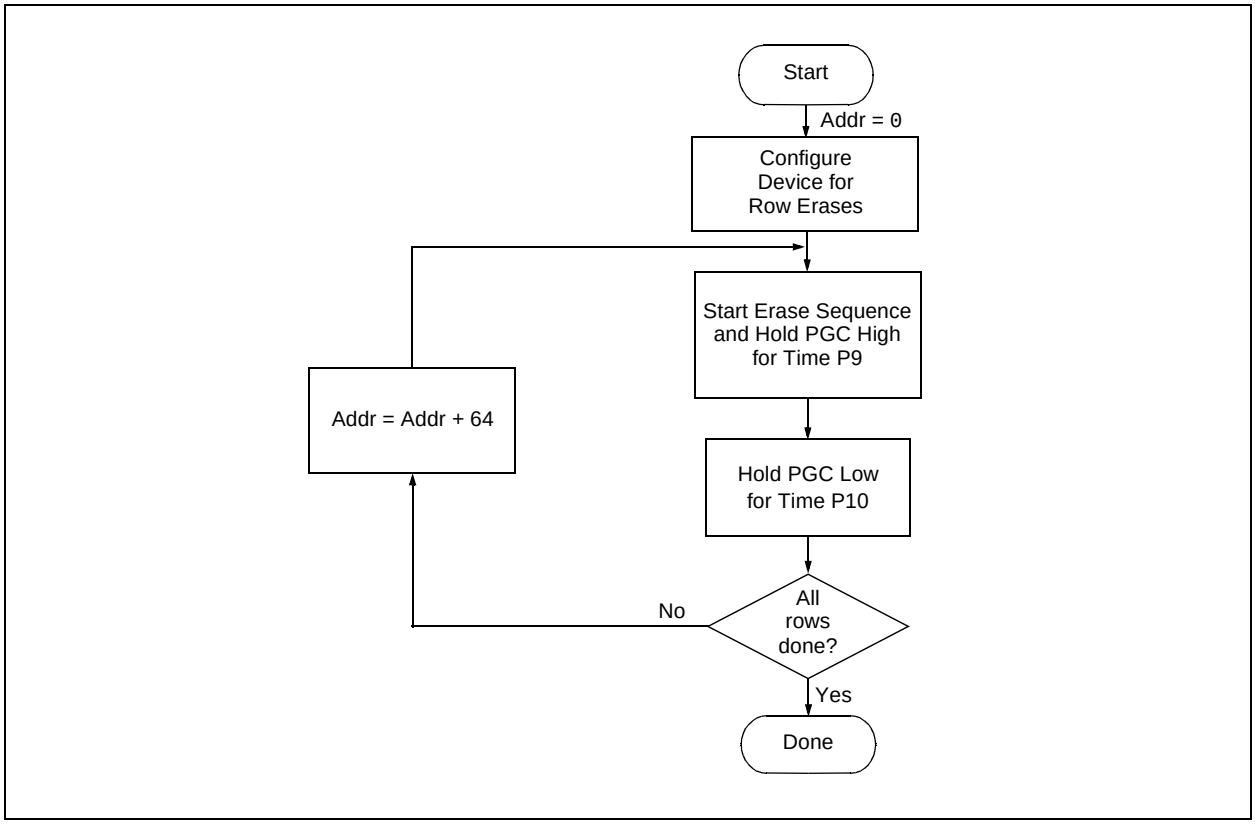
The code sequence to Row Erase a PIC18F2XXX/4XXX Family device is shown in Table 3-3. The flowchart, shown in Figure 3-3, depicts the logic necessary to completely erase a PIC18F2XXX/4XXX Family device. The timing diagram that details the Start Programming command and Parameters P9 and P10 is shown in Figure 3-5.

Note:	The TBLPTR register can point to any byte within the row intended for erase.

TABLE 3-3: ERASE CODE MEMORY CODE SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory and enable writes.		
0000	8E A6	BSF EECON1, EEPGD
0000	9C A6	BCF EECON1, CFGS
0000	84 A6	BSF EECON1, WREN
Step 2: Point to first row in code memory.		
0000	6A F8	CLRF TBLPTRU
0000	6A F7	CLRF TBLPTRH
0000	6A F6	CLRF TBLPTRL
Step 3: Enable erase and erase single row.		
0000	88 A6	BSF EECON1, FREE
0000	82 A6	BSF EECON1, WR
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.
Step 4: Repeat Step 3, with the Address Pointer incremented by 64 until all rows are erased.		

FIGURE 3-3: SINGLE ROW ERASE CODE MEMORY FLOW



3.2 Code Memory Programming

Programming code memory is accomplished by first loading data into the write buffer and then initiating a programming sequence. The write and erase buffer sizes, shown in Table 3-4, can be mapped to any location of the same size, beginning at 000000h. The actual memory write sequence takes the contents of this buffer and programs the proper amount of code memory that contains the Table Pointer.

The programming duration is externally timed and is controlled by PGC. After a Start Programming command is issued (4-bit command, '1111'), a NOP is issued, where the 4th PGC is held high for the duration of the programming time, P9.

After PGC is brought low, the programming sequence is terminated. PGC must be held low for the time specified by Parameter P10 to allow high-voltage discharge of the memory array.

The code sequence to program a PIC18F2XXX/4XXX Family device is shown in Table 3-5. The flowchart, shown in Figure 3-4, depicts the logic necessary to completely write a PIC18F2XXX/4XXX Family device. The timing diagram that details the Start Programming command and Parameters P9 and P10 is shown in Figure 3-5.

Note:	The TBLPTR register must point to the same region when initiating the programming sequence as it did when the write buffers were loaded.

TABLE 3-4: WRITE AND ERASE BUFFER SIZES

Devices (Arranged by Family)	Write Buffer Size (Bytes)	Erase Buffer Size (Bytes)
PIC18F2221, PIC18F2321, PIC18F4221, PIC18F4321	8	64
PIC18F2450, PIC18F4450	16	64
PIC18F2410, PIC18F2510, PIC18F4410, PIC18F4510	32	64
PIC18F2420, PIC18F2520, PIC18F4420, PIC18F4520		
PIC18F2423, PIC18F2523, PIC18F4423, PIC18F4523		
PIC18F2480, PIC18F2580, PIC18F4480, PIC18F4580		
PIC18F2455, PIC18F2550, PIC18F4455, PIC18F4550		
PIC18F2458, PIC18F2553, PIC18F4458, PIC18F4553		
PIC18F2515, PIC18F2610, PIC18F4515, PIC18F4610	64	64
PIC18F2525, PIC18F2620, PIC18F4525, PIC18F4620		
PIC18F2585, PIC18F2680, PIC18F4585, PIC18F4680		
PIC18F2682, PIC18F2685, PIC18F4682, PIC18F4685		

FIGURE 3-4: PROGRAM CODE MEMORY FLOW

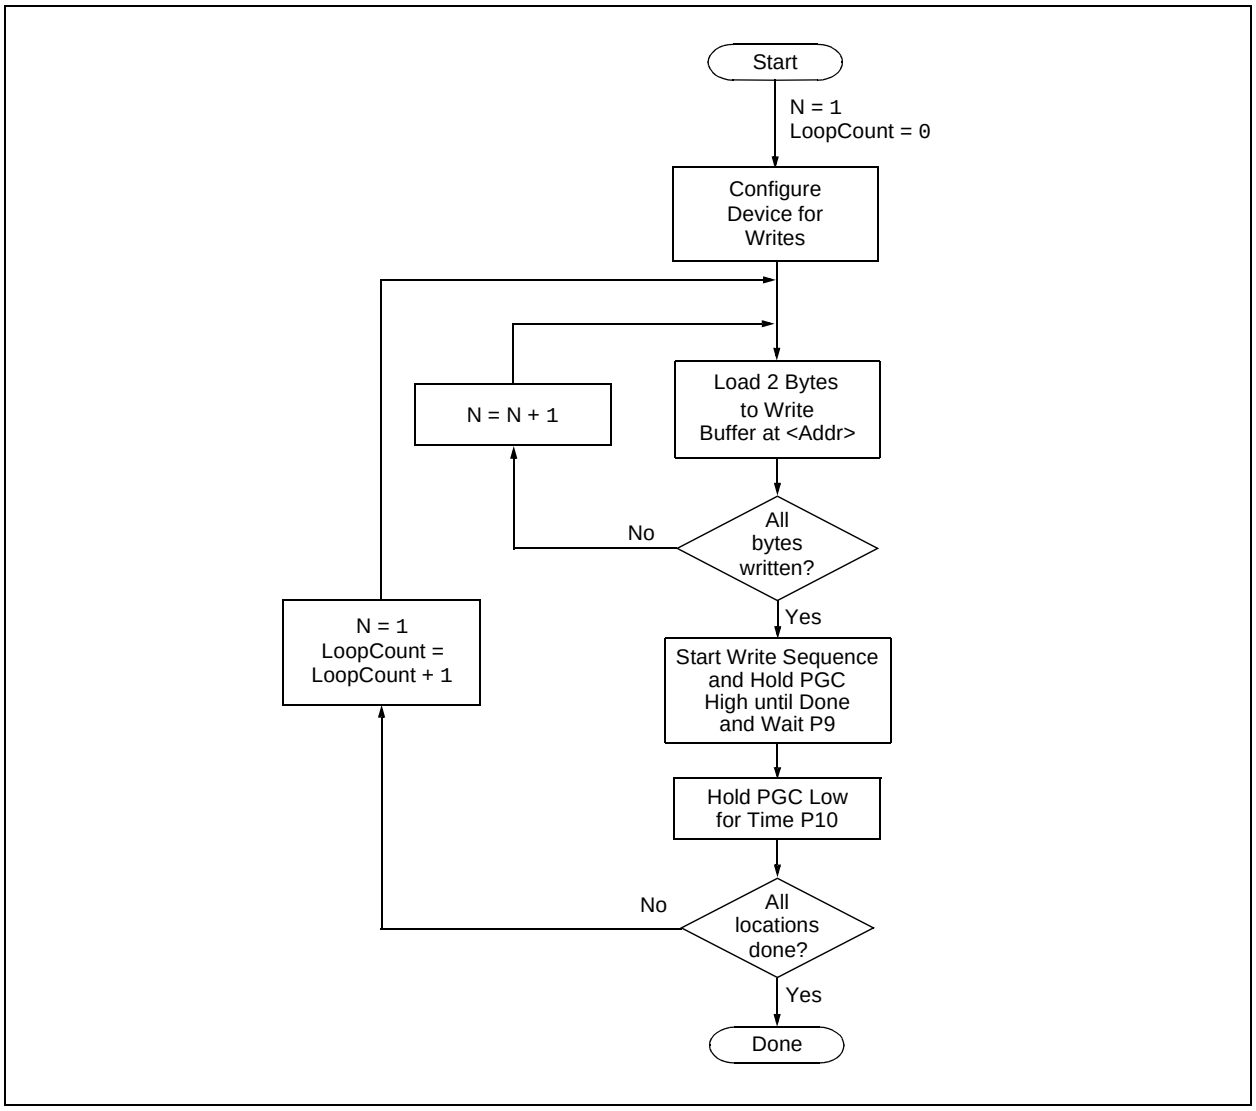


FIGURE 3-5: TABLE WRITE AND START PROGRAMMING INSTRUCTION TIMING (1111)

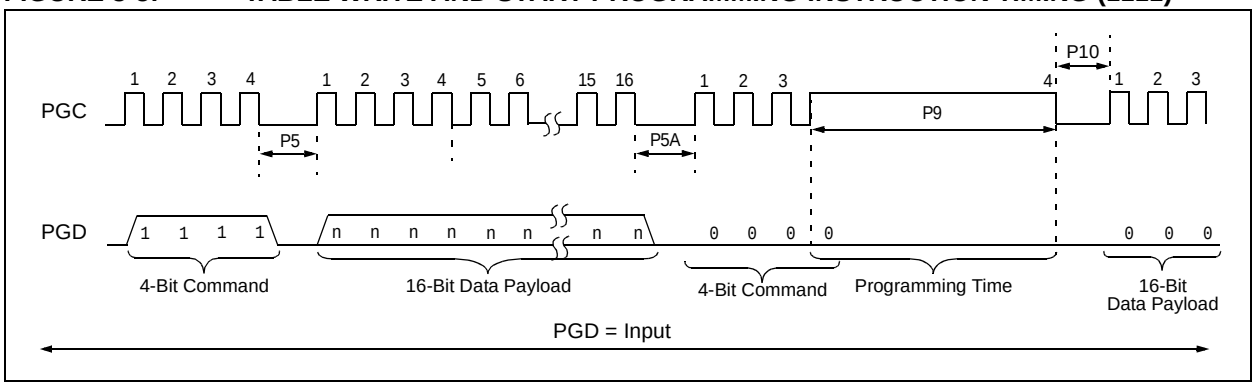
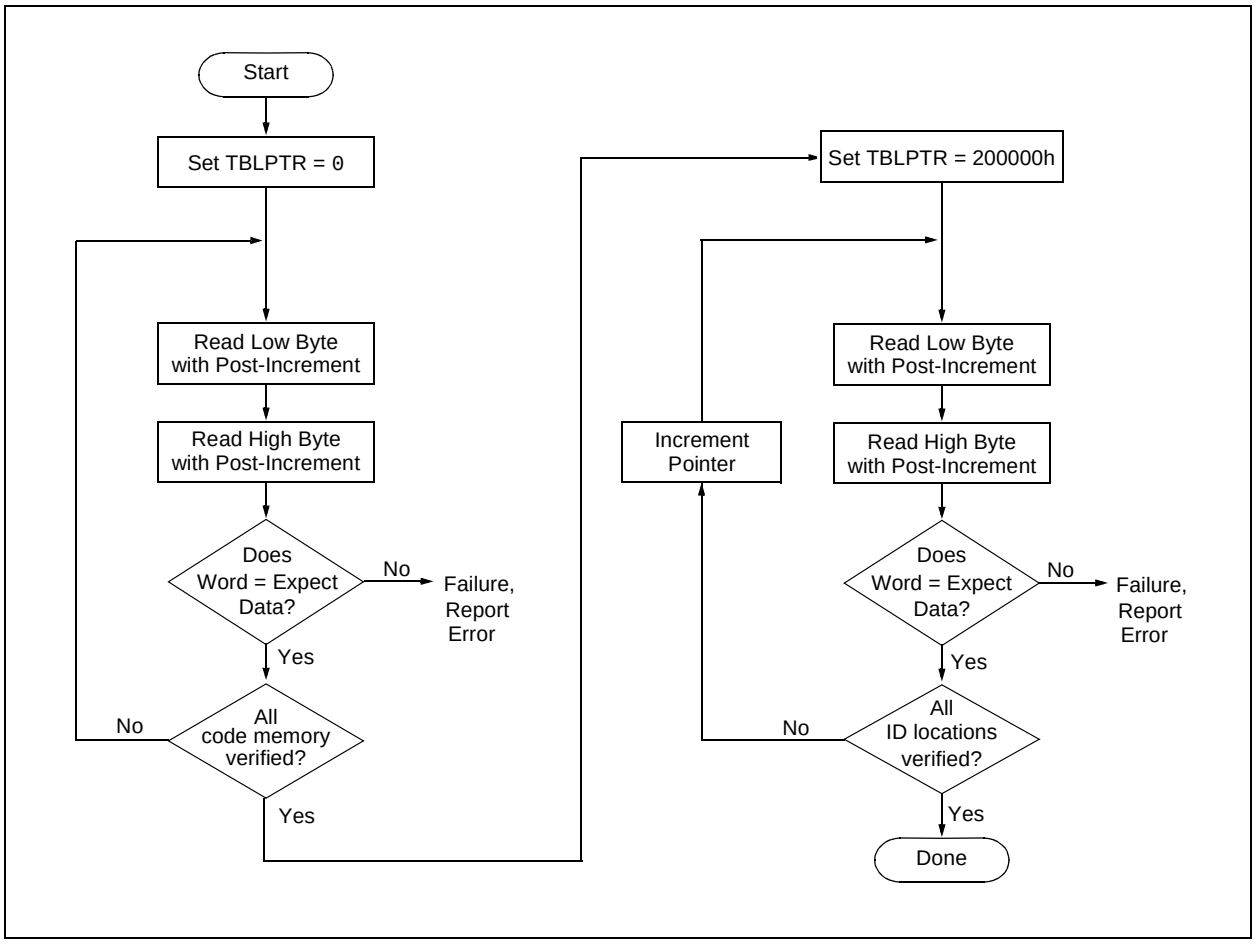


4.2 Verify Code Memory and ID Locations

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading code memory.

The Table Pointer must be manually set to 200000h (base address of the ID locations) once the code memory has been verified. The post-increment feature of the Table Read 4-bit command may not be used to increment the Table Pointer beyond the code memory space. In a 64-Kbyte device, for example, a post-increment read of address, FFFFh, will wrap the Table Pointer back to 000000h, rather than point to the unimplemented address, 010000h.

FIGURE 4-2: VERIFY CODE MEMORY FLOW



4.3 Verify Configuration Bits

A configuration address may be read and output on PGD via the 4-bit command, '1001'. Configuration data is read and written in a byte-wise fashion, so it is not necessary to merge two bytes into a word prior to a compare. The result may then be immediately compared to the appropriate configuration data in the programmer's memory for verification. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading configuration data.

4.4 Read Data EEPROM Memory

Data EEPROM is accessed, one byte at a time, via an Address Pointer (register pair: EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is read by loading EEADRH:EEADR with the desired memory location and initiating a memory read by appropriately configuring the EECON1 register. The data will be loaded into EEDATA, where it may be serially output on PGD via the 4-bit command, '0010' (Shift Out Data Holding register). A delay of P6 must be introduced after the falling edge of the 8th PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-4).

The command sequence to read a single byte of data is shown in Table 4-2.

FIGURE 4-3: READ DATA EEPROM FLOW

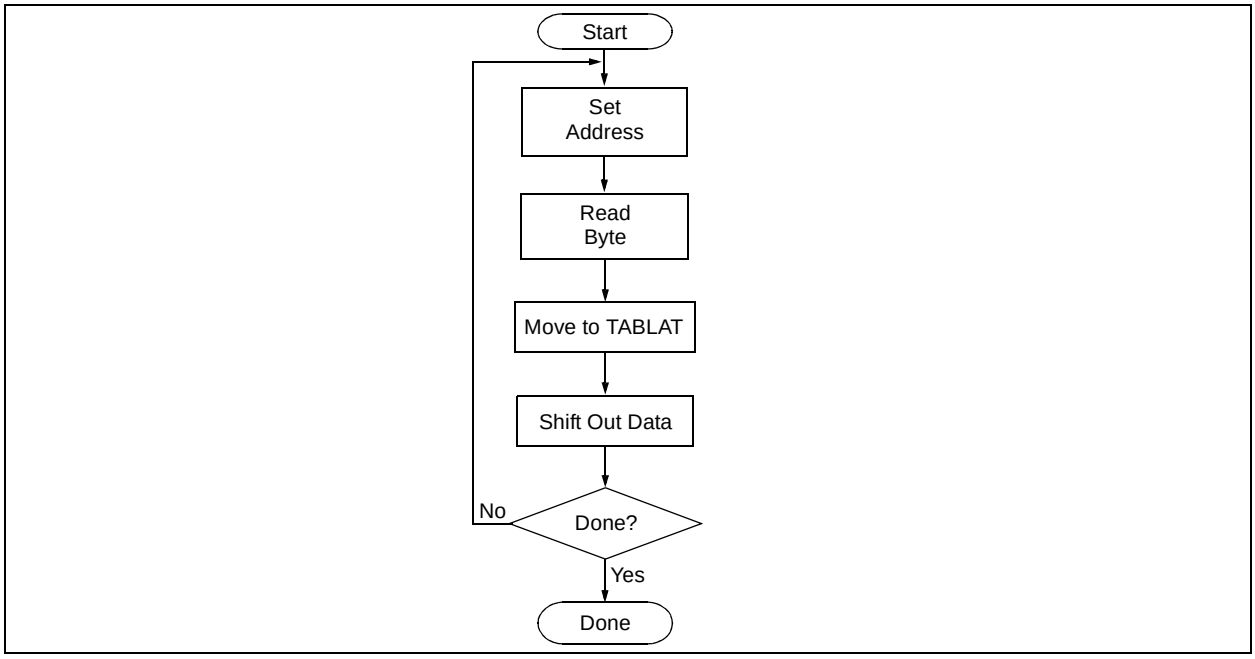


TABLE 4-2: READ DATA EEPROM MEMORY

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to data EEPROM.		
0000 0000	9E A6 9C A6	BCF EECON1, EEPGD BCF EECON1, CFGS

Legend: - = unimplemented. Shaded cells are unimplemented, read as '0'.

Note 1: Implemented only on PIC18F2455/2550/4455/4550 and PIC18F2458/2553/4458/4553 devices.

2: Implemented on PIC18F2585/2680/4585/4680, PIC18F2682/2685 and PIC18F4682/4685 devices only.

3: Implemented on PIC18F2480/2580/4480/4580 devices only.

4: These bits are only implemented on specific devices based on available memory. Refer to **Section 2.3 "Memory Maps"**.

5: In PIC18F2480/2580/4480/4580 devices, this bit is read-only in Normal Execution mode; it can be written only in Program mode.

6: DEVID registers are read-only and cannot be programmed by the user.

7: Implemented on all devices with the exception of the PIC18FXX8X and PIC18F2450/4450 devices.

8: Implemented on PIC18F2450/4450 devices only.

9: Implemented on PIC18F2682/2685 and PIC18F4682/4685 devices only.

10: Implemented on PIC18F2685/4685 devices only.

Bit Name	Configuration Words	Description
WRT5	CONFIG6L	Write Protection bit (Block 5 code memory area) **(PIC18F2685 and PIC18F4685 devices only)** 1 = Block 5 is not write-protected 0 = Block 5 is write-protected
WRT4	CONFIG6L	Write Protection bit (Block 4 code memory area) **(PIC18F2682/2685 and PIC18F4682/4685 devices only)** 1 = Block 4 is not write-protected 0 = Block 4 is write-protected
WRT3	CONFIG6L	Write Protection bit (Block 3 code memory area) 1 = Block 3 is not write-protected 0 = Block 3 is write-protected
WRT2	CONFIG6L	Write Protection bit (Block 2 code memory area) 1 = Block 2 is not write-protected 0 = Block 2 is write-protected
WRT1	CONFIG6L	Write Protection bit (Block 1 code memory area) 1 = Block 1 is not write-protected 0 = Block 1 is write-protected
WRT0	CONFIG6L	Write Protection bit (Block 0 code memory area) 1 = Block 0 is not write-protected 0 = Block 0 is write-protected
WRTD	CONFIG6H	Write Protection bit (Data EEPROM) 1 = Data EEPROM is not write-protected 0 = Data EEPROM is write-protected
WRTB	CONFIG6H	Write Protection bit (Boot Block memory area) 1 = Boot Block is not write-protected 0 = Boot Block is write-protected
WRTC	CONFIG6H	Write Protection bit (Configuration registers) 1 = Configuration registers are not write-protected 0 = Configuration registers are write-protected
EBTR5	CONFIG7L	Table Read Protection bit (Block 5 code memory area) **(PIC18F2685 and PIC18F4685 devices only)** 1 = Block 5 is not protected from Table Reads executed in other blocks 0 = Block 5 is protected from Table Reads executed in other blocks
EBTR4	CONFIG7L	Table Read Protection bit (Block 4 code memory area) **(PIC18F2682/2685 and PIC18F4682/4685 devices only)** 1 = Block 4 is not protected from Table Reads executed in other blocks 0 = Block 4 is protected from Table Reads executed in other blocks
EBTR3	CONFIG7L	Table Read Protection bit (Block 3 code memory area) 1 = Block 3 is not protected from Table Reads executed in other blocks 0 = Block 3 is protected from Table Reads executed in other blocks
EBTR2	CONFIG7L	Table Read Protection bit (Block 2 code memory area) 1 = Block 2 is not protected from Table Reads executed in other blocks 0 = Block 2 is protected from Table Reads executed in other blocks
EBTR1	CONFIG7L	Table Read Protection bit (Block 1 code memory area) 1 = Block 1 is not protected from Table Reads executed in other blocks 0 = Block 1 is protected from Table Reads executed in other blocks

Note 1: The BBSIZ bits, BBSIZ<1:0> and BBSIZ<2:1> bits, cannot be changed once any of the following code-protect bits are enabled: CPB or CP0, WRTB or WRT0, EBTRB or EBTR0.

2: Not available in PIC18FXX8X and PIC18F2450/4450 devices.

TABLE 5-4: DEVICE BLOCK LOCATIONS AND SIZES (CONTINUED)

Device	Memory Size (Bytes)	Pins	Ending Address							Size (Bytes)			
			Boot Block	Block 0	Block 1	Block 2	Block 3	Block 4	Block 5	Boot Block	Block 0	Remaining Blocks	Device Total
PIC18F4455	24K	40	0007FF	001FFF	003FFF	005FFF	—	—	—	2048	6144	16384	24576
