
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	40MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	36
Program Memory Size	16KB (8K x 16)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	768 x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5.5V
Data Converters	A/D 13x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	40-DIP (0.600", 15.24mm)
Supplier Device Package	40-PDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18lf4410-i-p

TABLE 2-2: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2515	000000h-00BFFFh (48K)
PIC18F2525	
PIC18F2585	
PIC18F4515

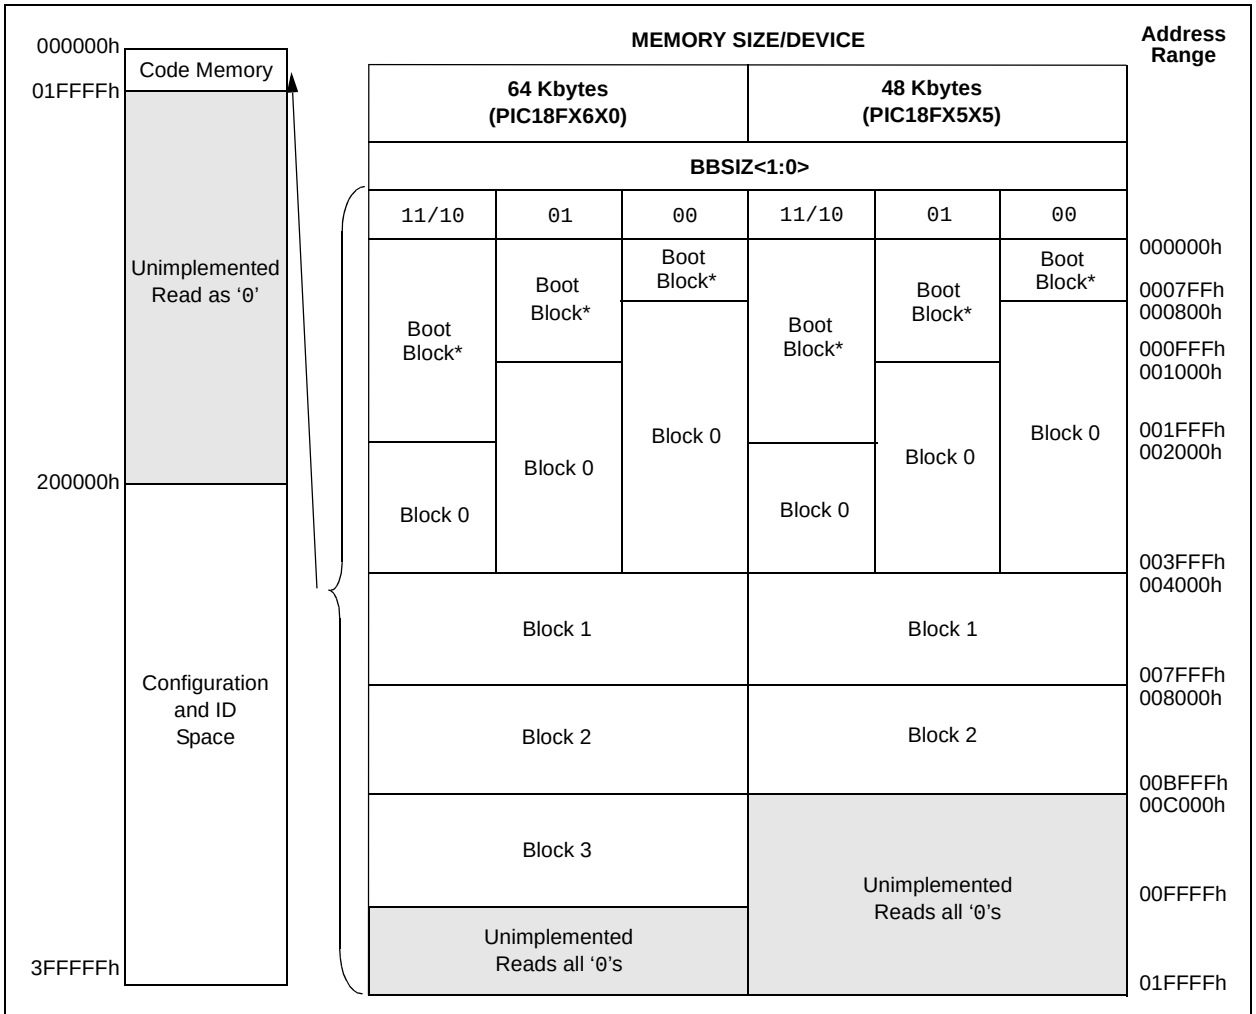
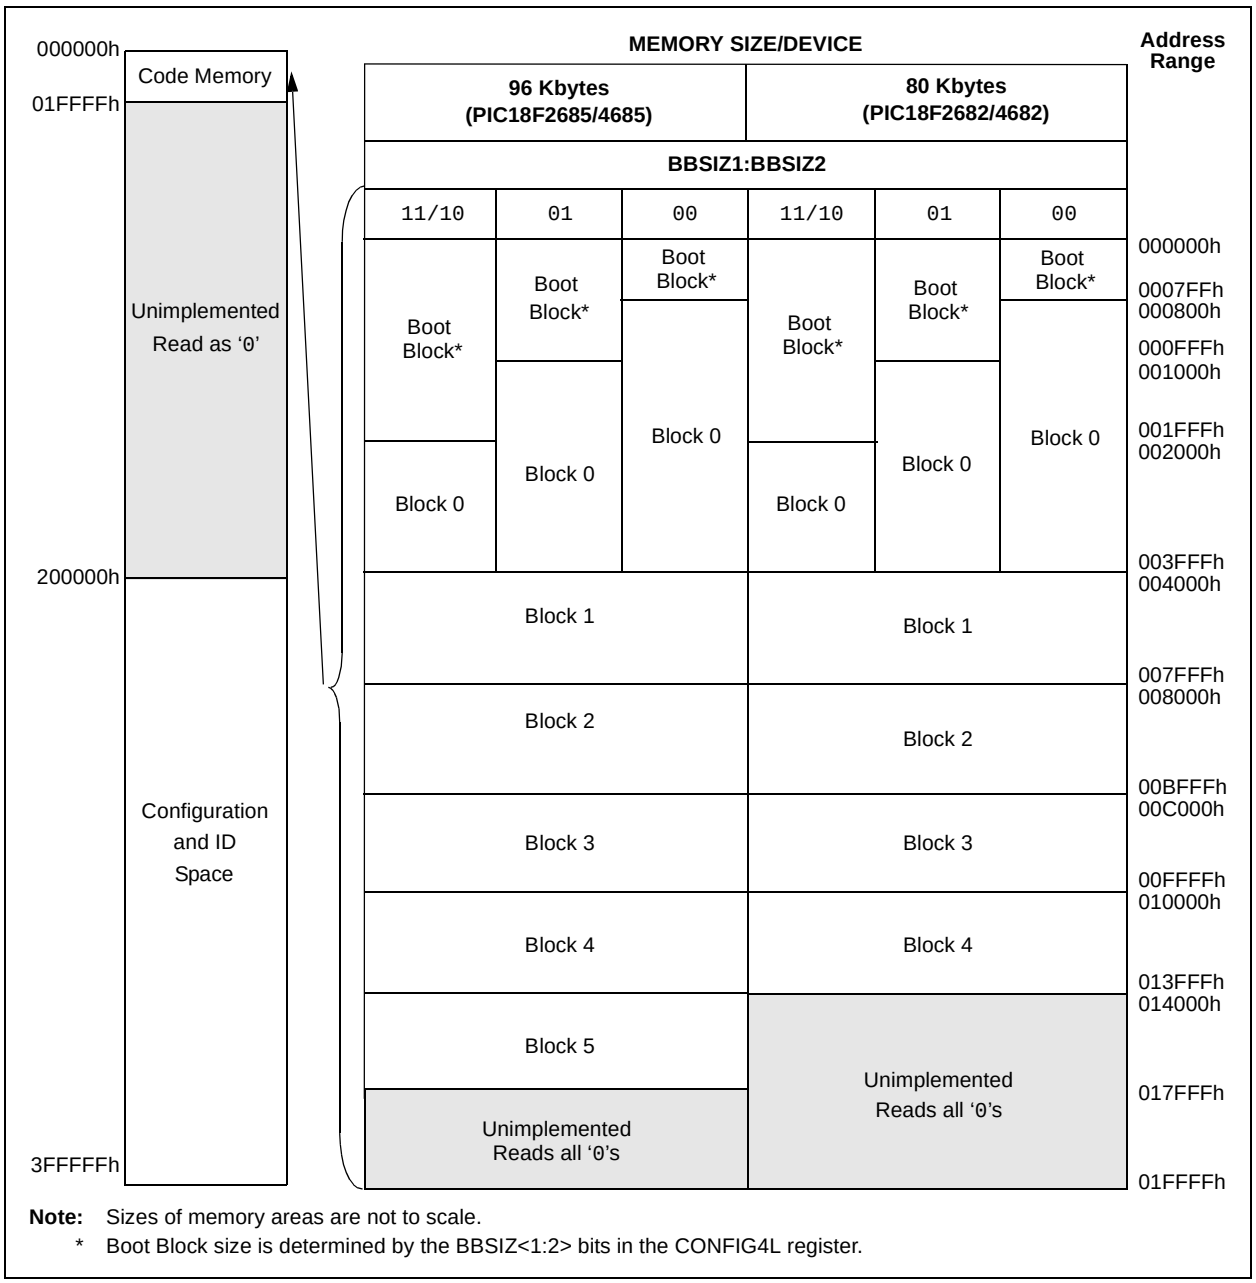
FIGURE 2-6: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX5X5/X6X0 DEVICES



Note: Sizes of memory areas are not to scale.

* Boot Block size is determined by the BBSIZ<1:0> bits in the CONFIG4L register.

FIGURE 2-7: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18F2685/4685 AND PIC18F2682/4682 DEVICES



Note: Sizes of memory areas are not to scale.

* Boot Block size is determined by the BBSIZ<1:2> bits in the CONFIG4L register.

For PIC18FX5X0/X5X3 devices, the code memory space extends from 000000h to 007FFFh (32 Kbytes) in four 8-Kbyte blocks. For PIC18FX4X5/X4X8 devices, the code memory space extends from 000000h to 005FFFh (24 Kbytes) in three 8-Kbyte blocks. Addresses, 000000h through 0007FFh, however, define a “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

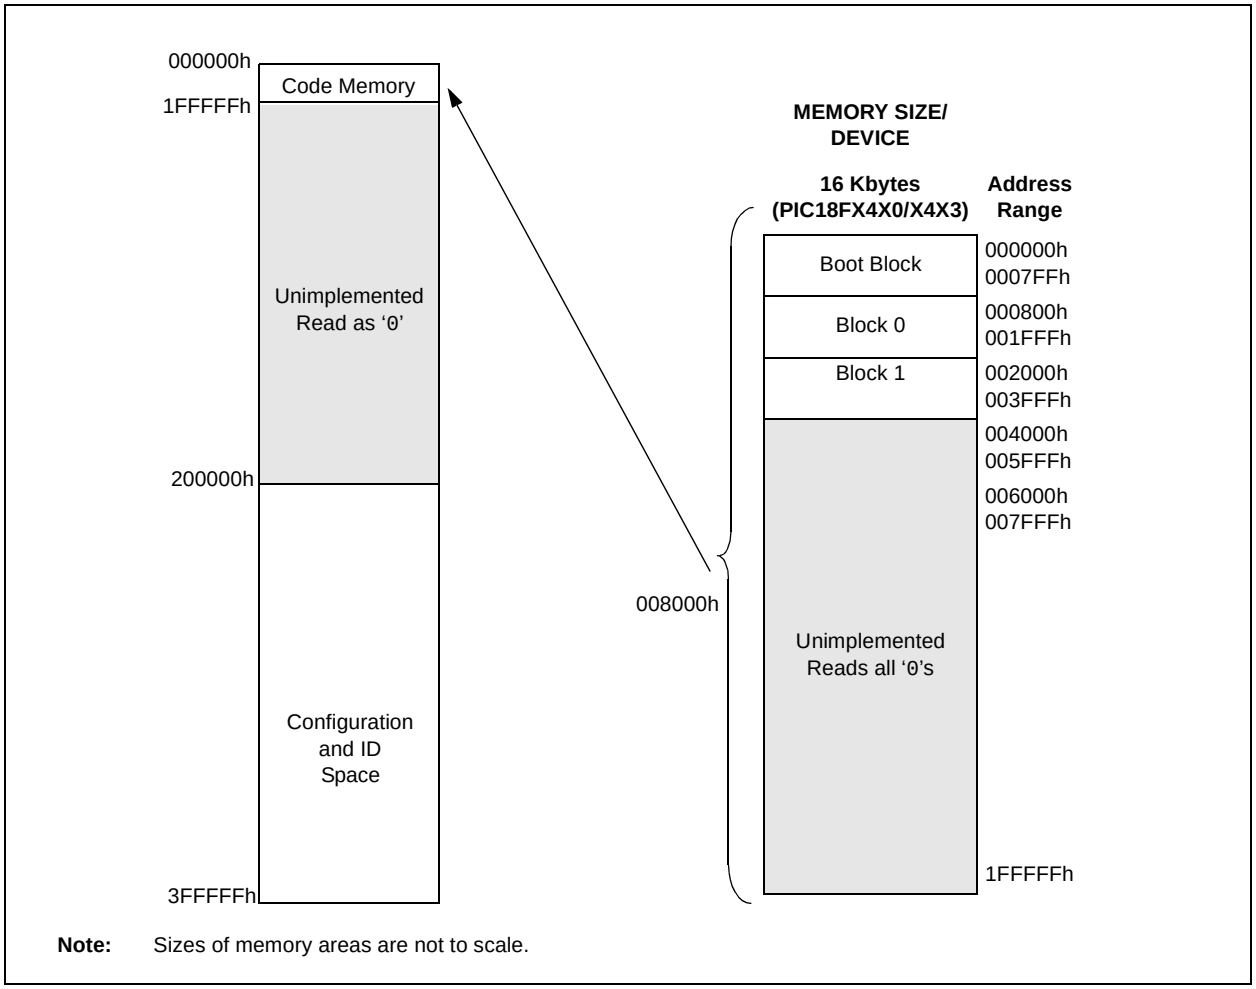
PIC18F4450	

FIGURE 2-9: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX4X0/X4X3 DEVICES



Note: Sizes of memory areas are not to scale.

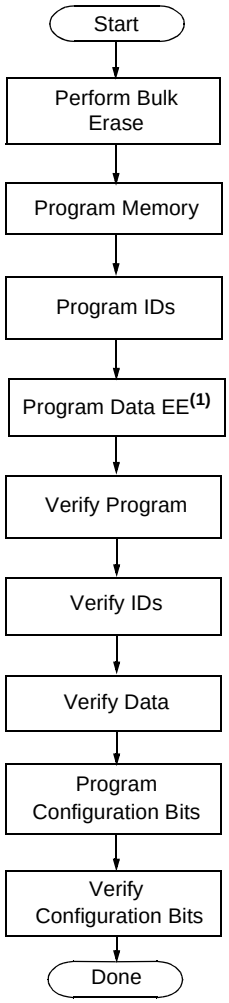
For PIC18F2480/4480 devices, the code memory space extends from 0000h to 03FFFh (16 Kbytes) in one 16-Kbyte block. For PIC18F2580/4580 devices, the code memory space extends from 0000h to 07FFFh (32 Kbytes) in two 16-Kbyte blocks. Addresses, 0000h through 07FFh, however, define a “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

The size of the Boot Block in PIC18F2480/2580/4480/4580 devices can be configured as 1 or 2K words (see Figure 2-10). This is done through the BBSIZ<0> bit in the Configuration register, CONFIG4L. It is important to note that increasing the size of the Boot Block decreases the size of Block 0.

2.4 High-Level Overview of the Programming Process

Figure 2-13 shows the high-level overview of the programming process. First, a Bulk Erase is performed. Next, the code memory, ID locations and data EEPROM are programmed (selected devices only, see **Section 3.3 "Data EEPROM Programming"**). These memories are then verified to ensure that programming was successful. If no errors are detected, the Configuration bits are then programmed and verified.

FIGURE 2-13: HIGH-LEVEL PROGRAMMING FLOW



Note 1: Selected devices only, see **Section 3.3 "Data EEPROM Programming"**.

2.5 Entering and Exiting High-Voltage ICSP Program/Verify Mode

As shown in Figure 2-14, the High-Voltage ICSP Program/Verify mode is entered by holding PGC and PGD low and then raising $\overline{MCLR}$/VPP/RE3 to VIHH (high voltage). Once in this mode, the code memory, data EEPROM (selected devices only, see **Section 3.3 "Data EEPROM Programming"**), ID locations and Configuration bits can be accessed and programmed in serial fashion. Figure 2-15 shows the exit sequence.

The sequence that enters the device into the Program/Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-14: ENTERING HIGH-VOLTAGE PROGRAM/VERIFY MODE

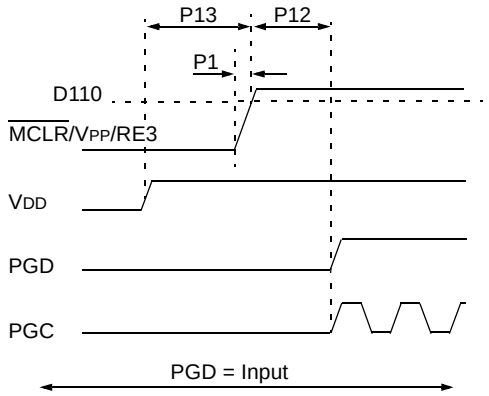


FIGURE 2-15: EXITING HIGH-VOLTAGE PROGRAM/VERIFY MODE

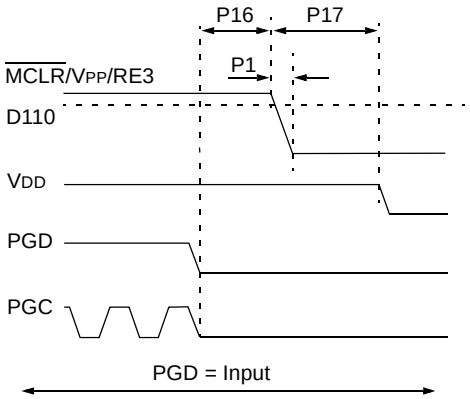

FIGURE 2-18: TABLE WRITE, POST-INCREMENT TIMING (1101)

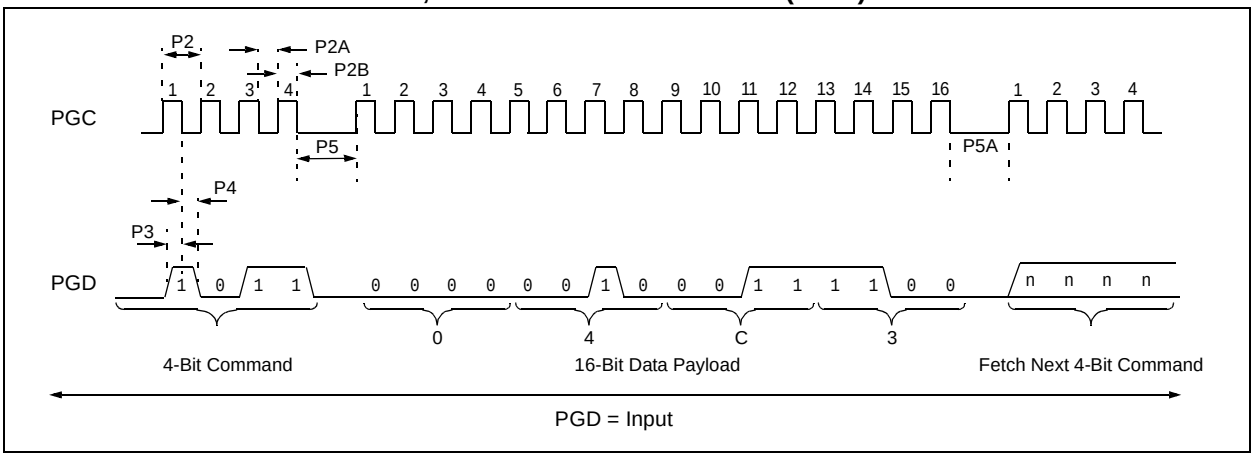


2.8 Dedicated ICSP/ICD Port (44-Pin TQFP Only)

The PIC18F4455/4458/4550/4553 44-pin TQFP devices are designed to support an alternate programming input: the dedicated ICSP/ICD port. The primary purpose of this port is to provide an alternate In-Circuit Debugging (ICD) option and free the pins (RB6, RB7 and MCLR) that would normally be used for debugging the application. In conjunction with ICD capability, however, the dedicated ICSP/ICD port also provides an alternate port for ICSP.

Setting the ICPRT Configuration bit enables the dedicated ICSP/ICD port. The dedicated ICSP/ICD port functions the same as the default ICSP/ICD port; however, alternate pins are used instead of the default pins. Table 2-10 identifies the functionally equivalent pins for ICSP purposes:

The dedicated ICSP/ICD port is an alternate port. Thus, ICSP is still available through the default port even though the ICPRT Configuration bit is set. When the V_{IH} is seen on the MCLR/V_{PP}/RE3 pin prior to applying V_{IH} to the ICRST/ICV$_{PP}$ pin, then the state of the ICRST/ICV$_{PP}$ pin is ignored. Likewise, when the V_{IH} is seen on ICRST/ICV$_{PP}$ prior to applying V_{IH} to MCLR/V_{PP}/RE3, then the state of the MCLR/V_{PP}/RE3 pin is ignored.

Note:	The ICPRT Configuration bit can only be programmed through the default ICSP port. Chip Erase functions through the dedicated ICSP/ICD port do not affect this bit. When the ICPRT Configuration bit is set (dedicated ICSP/ICD port enabled), the NC/ICPORTS pin must be tied to either V_{DD} or V_{SS}. The ICPRT Configuration bit must be maintained clear for all 28-pin and 40-pin devices; otherwise, unexpected operation may occur.

TABLE 2-10: ICSP™ EQUIVALENT PINS

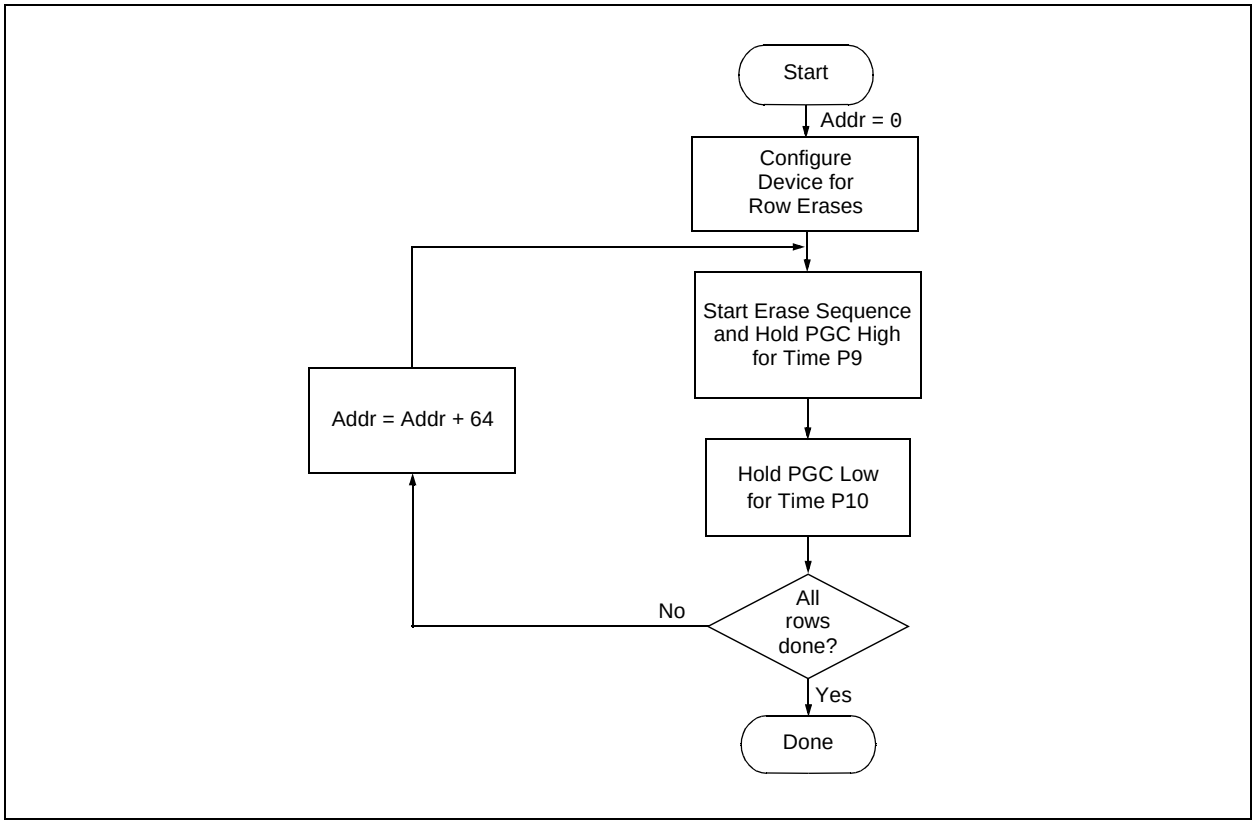
Pin Name	During Programming			
	Pin Name	Pin Type	Dedicated Pins	Pin Description
MCLR/V_{PP}/RE3	V_{PP}	P	NC/ICRST/ICV$_{PP}$	Programming Enable
RB6	PGC	I	NC/ICCK/ICPGC	Serial Clock
RB7	PGD	I/O	NC/ICDT/ICPGD	Serial Data

Legend: I = Input, O = Output, P = Power

TABLE 3-3: ERASE CODE MEMORY CODE SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory and enable writes.		
0000	8E A6	BSF EECON1, EEPGD
0000	9C A6	BCF EECON1, CFGS
0000	84 A6	BSF EECON1, WREN
Step 2: Point to first row in code memory.		
0000	6A F8	CLRF TBLPTRU
0000	6A F7	CLRF TBLPTRH
0000	6A F6	CLRF TBLPTRL
Step 3: Enable erase and erase single row.		
0000	88 A6	BSF EECON1, FREE
0000	82 A6	BSF EECON1, WR
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.
Step 4: Repeat Step 3, with the Address Pointer incremented by 64 until all rows are erased.		

FIGURE 3-3: SINGLE ROW ERASE CODE MEMORY FLOW



3.3 Data EEPROM Programming

Note: Data EEPROM programming is **not** available on the following devices:	
PIC18F2410	PIC18F4410
PIC18F2450	PIC18F4450
PIC18F2510	PIC18F4510
PIC18F2515	PIC18F4515
PIC18F2610	PIC18F4610

Data EEPROM is accessed one byte at a time via an Address Pointer (register pair: EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is written by loading EEADRH:EEADR with the desired memory location, EEDATA, with the data to be written and initiating a memory write by appropriately configuring the EECON1 register. A byte write automatically erases the location and writes the new data (erase-before-write).

When using the EECON1 register to perform a data EEPROM write, both the EEPGD and CFGS bits must be cleared (EECON1<7:6> = 00). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort and this must be done prior to initiating a write sequence. The write sequence is initiated by setting the WR bit (EECON1<1> = 1).

The write begins on the falling edge of the 4th PGC after the WR bit is set. It ends when the WR bit is cleared by hardware.

After the programming sequence terminates, PGC must still be held low for the time specified by Parameter P10 to allow high-voltage discharge of the memory array.

FIGURE 3-6: PROGRAM DATA FLOW

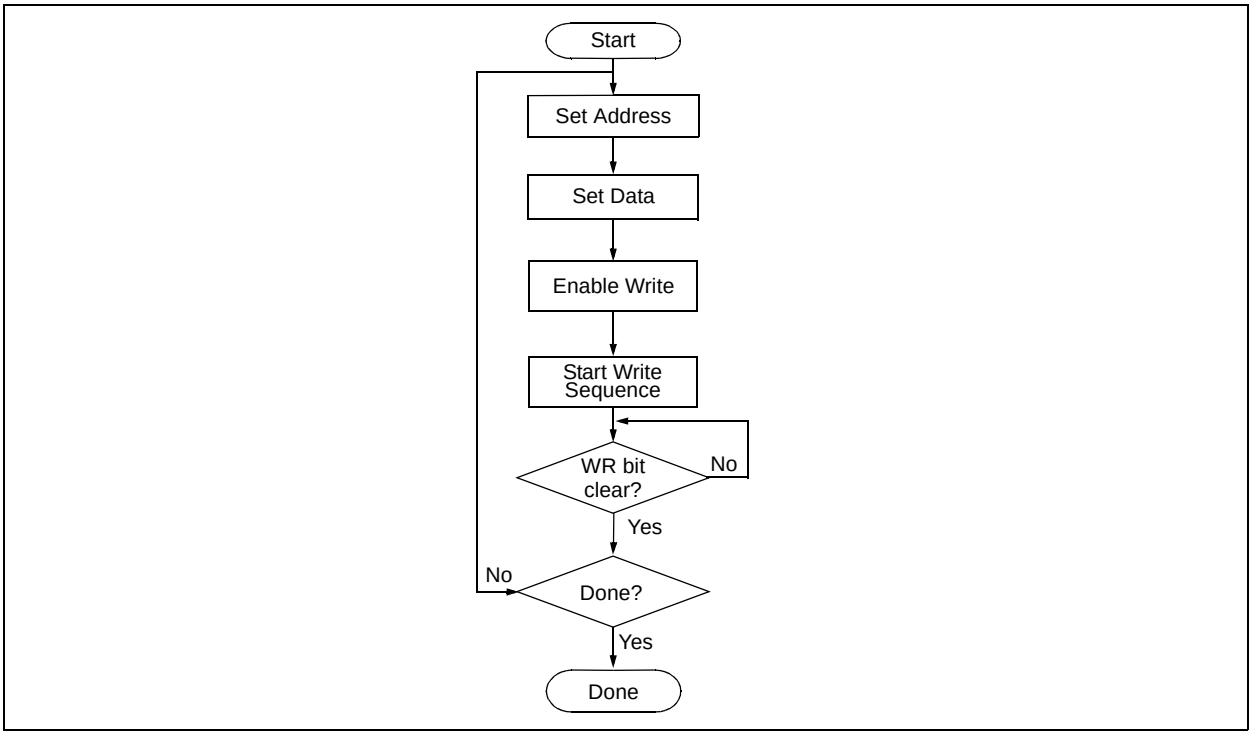


TABLE 3-7: PROGRAMMING DATA MEMORY

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to data EEPROM.		
0000	9E A6	BCF EECON1, EEPGD
0000	9C A6	BCF EECON1, CFGS
Step 2: Set the data EEPROM Address Pointer.		
0000	0E <Addr>	MOVLW <Addr>
0000	6E A9	MOVWF EEADR
0000	OE <AddrH>	MOVLW <AddrH>
0000	6E AA	MOVWF EEADRH
Step 3: Load the data to be written.		
0000	0E <Data>	MOVLW <Data>
0000	6E A8	MOVWF EEDATA
Step 4: Enable memory writes.		
0000	84 A6	BSF EECON1, WREN
Step 5: Initiate write.		
0000	82 A6	BSF EECON1, WR
Step 6: Poll WR bit, repeat until the bit is clear.		
0000	50 A6	MOVF EECON1, W, 0
0000	6E F5	MOVWF TABLAT
0000	00 00	NOP
0010	<MSB><LSB>	Shift out data(1)
Step 7: Hold PGC low for time P10.		
Step 8: Disable writes.		
0000	94 A6	BCF EECON1, WREN
Repeat Steps 2 through 8 to write more data.		

Note 1: See Figure 4-4 for details on shift out data timing.

4.4 Read Data EEPROM Memory

Data EEPROM is accessed, one byte at a time, via an Address Pointer (register pair: EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is read by loading EEADRH:EEADR with the desired memory location and initiating a memory read by appropriately configuring the EECON1 register. The data will be loaded into EEDATA, where it may be serially output on PGD via the 4-bit command, '0010' (Shift Out Data Holding register). A delay of P6 must be introduced after the falling edge of the 8th PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-4).

The command sequence to read a single byte of data is shown in Table 4-2.

FIGURE 4-3: READ DATA EEPROM FLOW

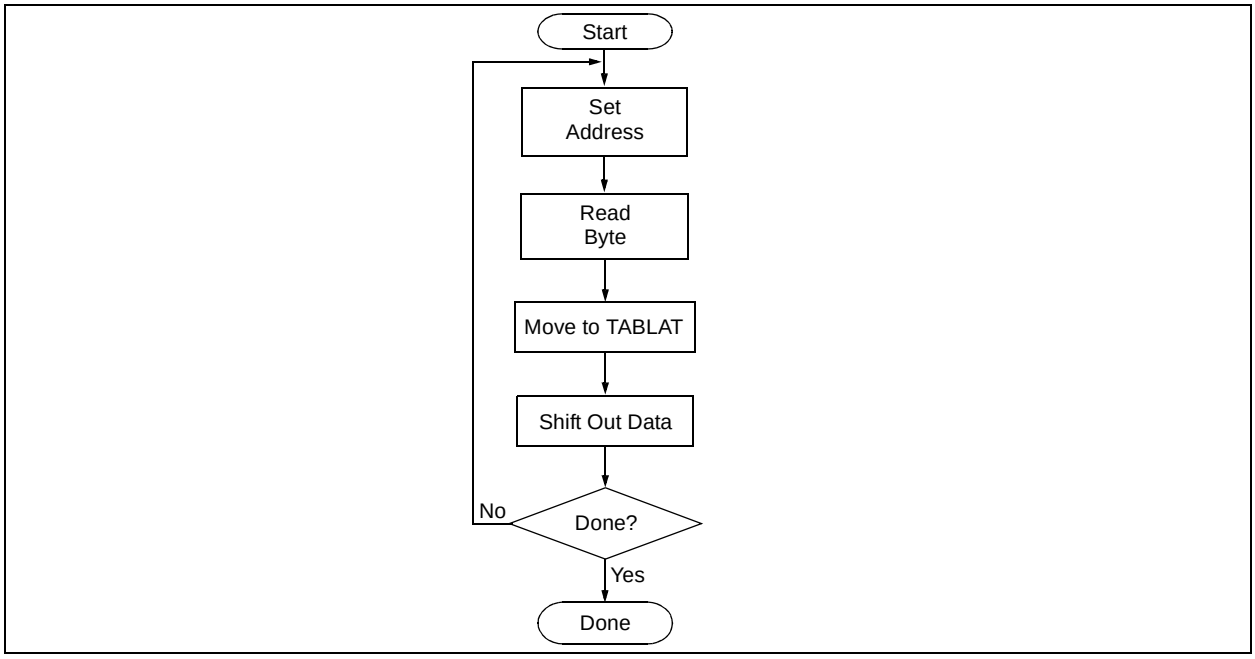

TABLE 4-2: READ DATA EEPROM MEMORY

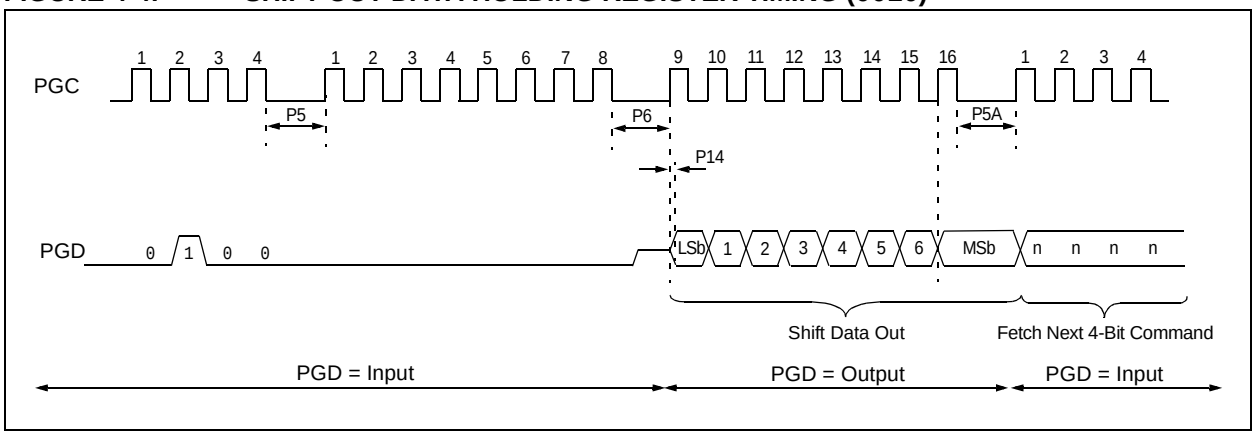
4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to data EEPROM.		
0000 0000	9E A6 9C A6	BCF EECON1, EEPGD BCF EECON1, CFGS
Step 2: Set the data EEPROM Address Pointer.		
0000 0000 0000 0000	0E <Addr> 6E A9 OE <AddrH> 6E AA	MOVLW <Addr> MOVWF EEADR MOVLW <AddrH> MOVWF EEADRH
Step 3: Initiate a memory read.		
0000	80 A6	BSF EECON1, RD
Step 4: Load data into the Serial Data Holding register.		
0000 0000 0000 0010	50 A8 6E F5 00 00 <MSB><LSB>	MOVF EEDATA, W, 0 MOVWF TABLAT NOP Shift Out Data(1)

Note 1: The <LSB> is undefined. The <MSB> is the data.

FIGURE 4-4: SHIFT OUT DATA HOLDING REGISTER TIMING (0010)



4.5 Verify Data EEPROM

A data EEPROM address may be read via a sequence of core instructions (4-bit command, '0000') and then output on PGD via the 4-bit command, '0010' (TABLAT register). The result may then be immediately compared to the appropriate data in the programmer's memory for verification. Refer to **Section 4.4 "Read Data EEPROM Memory"** for implementation details of reading data EEPROM.

4.6 Blank Check

The term Blank Check means to verify that the device has no programmed memory cells. All memories must be verified: code memory, data EEPROM, ID locations and Configuration bits. The Device ID registers (3FFFFEh:3FFFFFh) should be ignored.

A "blank" or "erased" memory cell will read as '1'. Therefore, Blank Checking a device merely means to verify that all bytes read as FFh, except the Configuration bits. Unused (reserved) Configuration bits will read '0' (programmed). Refer to Figure 4-5 for blank configuration expect data for the various PIC18F2XXX/4XXX Family devices.

Given that Blank Checking is merely code and data EEPROM verification with FFh expect data, refer to **Section 4.4 "Read Data EEPROM Memory"** and **Section 4.2 "Verify Code Memory and ID Locations"** for implementation details.

FIGURE 4-5: BLANK CHECK FLOW

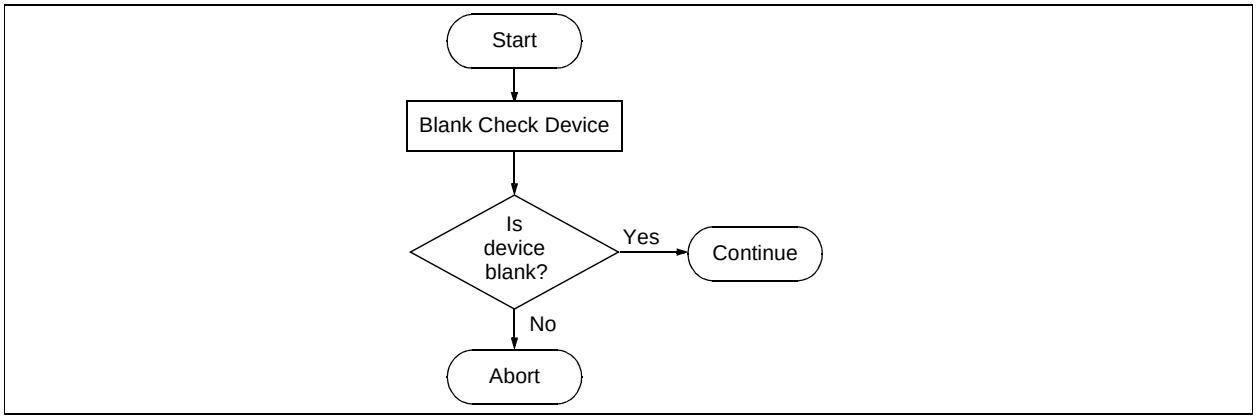


TABLE 5-2: DEVICE ID VALUES (CONTINUED)

Device	Device ID Value	
	DEVID2	DEVID1
PIC18F4585	0Eh	101x xxxx
PIC18F4610	0Ch	001x xxxx
PIC18F4620	0Ch	000x xxxx
PIC18F4680	0Eh	100x xxxx
PIC18F4682	27h	010x xxxx
PIC18F4685	27h	011x xxxx

Legend: The 'x's in DEVID1 contain the device revision code.
Note 1: DEVID1 bit 4 is used to determine the device type (REV4 = 0).
2: DEVID1 bit 4 is used to determine the device type (REV4 = 1).

TABLE 5-3: PIC18F2XXX/4XXX FAMILY BIT DESCRIPTIONS (CONTINUED)

Bit Name	Configuration Words	Description
BBSIZ<1:0>(1)	CONFIG4L	Boot Block Size Select bits **(PIC18F2321/4321 devices only)** 11 = 1K word (2 Kbytes) Boot Block 10 = 1K word (2 Kbytes) Boot Block 01 = 512 words (1 Kbyte) Boot Block 00 = 256 words (512 bytes) Boot Block Boot Block Size Select bits **(PIC18F2221/4221 devices only)** 11 = 512 words (1 Kbyte) Boot Block 10 = 512 words (1 Kbyte) Boot Block 01 = 512 words (1 Kbyte) Boot Block 00 = 256 words (512 bytes) Boot Block
BBSIZ(1)	CONFIG4L	Boot Block Size Select bits **(PIC18F2480/2580/4480/4580 and PIC18F2450/4450 devices only)** 1 = 2K words (4 Kbytes) Boot Block 0 = 1K word (2 Kbytes) Boot Block
LVP	CONFIG4L	Low-Voltage Programming Enable bit 1 = Low-Voltage Programming is enabled, RB5 is the PGM pin 0 = Low-Voltage Programming is disabled, RB5 is an I/O pin
STVREN	CONFIG4L	Stack Overflow/Underflow Reset Enable bit 1 = Reset on stack overflow/underflow is enabled 0 = Reset on stack overflow/underflow is disabled
CP5	CONFIG5L	Code Protection bit (Block 5 code memory area) **(PIC18F2685 and PIC18F4685 devices only)** 1 = Block 5 is not code-protected 0 = Block 5 is code-protected
CP4	CONFIG5L	Code Protection bit (Block 4 code memory area) **(PIC18F2682/2685 and PIC18F4682/4685 devices only)** 1 = Block 4 is not code-protected 0 = Block 4 is code-protected
CP3	CONFIG5L	Code Protection bit (Block 3 code memory area) 1 = Block 3 is not code-protected 0 = Block 3 is code-protected
CP2	CONFIG5L	Code Protection bit (Block 2 code memory area) 1 = Block 2 is not code-protected 0 = Block 2 is code-protected
CP1	CONFIG5L	Code Protection bit (Block 1 code memory area) 1 = Block 1 is not code-protected 0 = Block 1 is code-protected
CP0	CONFIG5L	Code Protection bit (Block 0 code memory area) 1 = Block 0 is not code-protected 0 = Block 0 is code-protected
CPD	CONFIG5H	Code Protection bit (Data EEPROM) 1 = Data EEPROM is not code-protected 0 = Data EEPROM is code-protected
CPB	CONFIG5H	Code Protection bit (Boot Block memory area) 1 = Boot Block is not code-protected 0 = Boot Block is code-protected

Note 1: The BBSIZ bits, BBSIZ<1:0> and BBSIZ<2:1> bits, cannot be changed once any of the following code-protect bits are enabled: CPB or CP0, WRTB or WRT0, EBTRB or EBTR0.

2: Not available in PIC18FXX8X and PIC18F2450/4450 devices.

5.3 Single-Supply ICSP Programming

The LVP bit in Configuration register, CONFIG4L, enables Single-Supply (Low-Voltage) ICSP Programming. The LVP bit defaults to a '1' (enabled) from the factory.

If Single-Supply Programming mode is not used, the LVP bit can be programmed to a '0' and RB5/PGM becomes a digital I/O pin. However, the LVP bit may only be programmed by entering the High-Voltage ICSP mode, where MCLR/VPP/RE3 is raised to VIHH. Once the LVP bit is programmed to a '0', only the High-Voltage ICSP mode is available and only the High-Voltage ICSP mode can be used to program the device.

Note 1: The High-Voltage ICSP mode is always available, regardless of the state of the LVP bit, by applying VIHH to the MCLR/VPP/RE3 pin.

2: While in Low-Voltage ICSP mode, the RB5 pin can no longer be used as a general purpose I/O.

5.4 Embedding Configuration Word Information in the HEX File

To allow portability of code, a PIC18F2XXX/4XXX Family programmer is required to read the Configuration Word locations from the hex file. If Configuration Word information is not present in the hex file, then a simple warning message should be issued. Similarly, while saving a hex file, all Configuration Word information must be included. An option to not include the Configuration Word information may be provided. When embedding Configuration Word information in the hex file, it should start at address, 300000h.

Microchip Technology Inc. feels strongly that this feature is important for the benefit of the end customer.

5.5 Embedding Data EEPROM Information In the HEX File

To allow portability of code, a PIC18F2XXX/4XXX Family programmer is required to read the data EEPROM information from the hex file. If data EEPROM information is not present, a simple warning message should be issued. Similarly, when saving a hex file, all data EEPROM information must be included. An option to not include the data EEPROM information may be provided. When embedding data EEPROM information in the hex file, it should start at address, F00000h.

Microchip Technology Inc. believes that this feature is important for the benefit of the end customer.

5.6 Checksum Computation

The checksum is calculated by summing the following:

- The contents of all code memory locations
- The Configuration Words, appropriately masked
- ID locations (if any block is code-protected)

The Least Significant 16 bits of this sum is the checksum. The contents of the data EEPROM are not used.

5.6.1 PROGRAM MEMORY

When program memory contents are summed, each 16-bit word is added to the checksum. The contents of program memory, from 000000h to the end of the last program memory block, are used for this calculation. Overflows from bit 15 may be ignored.

5.6.2 CONFIGURATION WORDS

For checksum calculations, unimplemented bits in Configuration Words should be ignored as such bits always read back as '1's. Each 8-bit Configuration Word is ANDed with a corresponding mask to prevent unused bits from affecting checksum calculations.

The mask contains a '0' in unimplemented bit positions, or a '1' where a choice can be made. When ANDed with the value read out of a Configuration Word, only implemented bits remain. A list of suitable masks is provided in Table 5-5.

TABLE 5-4: DEVICE BLOCK LOCATIONS AND SIZES

Device	Memory Size (Bytes)	Pins	Ending Address							Size (Bytes)			
			Boot Block	Block 0	Block 1	Block 2	Block 3	Block 4	Block 5	Boot Block	Block 0	Remaining Blocks	Device Total

Legend: Shaded cells are unimplemented.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
═ ISO/TS 16949 ═

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
