
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

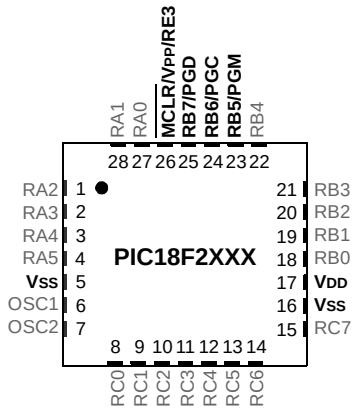
Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	40MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	36
Program Memory Size	32KB (16K x 16)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1.5K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5.5V
Data Converters	A/D 13x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VQFN Exposed Pad
Supplier Device Package	44-QFN (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18lf4510-i-ml

The following devices are included in 28-pin QFN parts:

- PIC18F2221
- PIC18F2321
- PIC18F2410
- PIC18F2420
- PIC18F2423
- PIC18F2450
- PIC18F2480
- PIC18F2510
- PIC18F2520
- PIC18F2523
- PIC18F2580
- PIC18F2682
- PIC18F2685

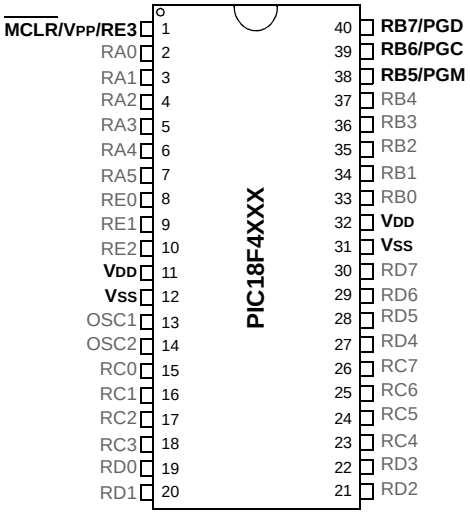
FIGURE 2-2: 28-Pin QFN



The following devices are included in 40-pin PDIP parts:

- PIC18F4221
- PIC18F4321
- PIC18F4410
- PIC18F4420
- PIC18F4423
- PIC18F4450
- PIC18F4455
- PIC18F4458
- PIC18F4480
- PIC18F4510
- PIC18F4515
- PIC18F4520
- PIC18F4523
- PIC18F4525
- PIC18F4550
- PIC18F4553
- PIC18F4580
- PIC18F4585
- PIC18F4610
- PIC18F4620
- PIC18F4680
- PIC18F4682
- PIC18F4685

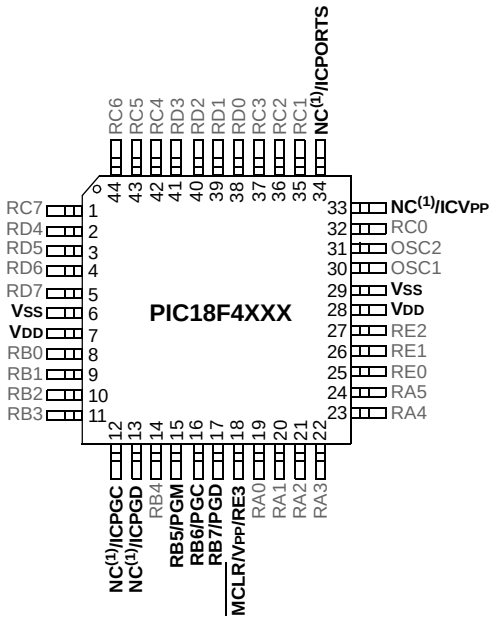
FIGURE 2-3: 40-Pin PDIP



The following devices are included in 44-pin TQFP parts:

- PIC18F4221
- PIC18F4321
- PIC18F4410
- PIC18F4420
- PIC18F4423
- PIC18F4450
- PIC18F4455
- PIC18F4458
- PIC18F4480
- PIC18F4510
- PIC18F4520
- PIC18F4515
- PIC18F4523
- PIC18F4525
- PIC18F4550
- PIC18F4553
- PIC18F4580
- PIC18F4585
- PIC18F4610
- PIC18F4620
- PIC18F4680
- PIC18F4682
- PIC18F4685

FIGURE 2-4: 44-PIN TQFP



Note 1: These pins are NC (No Connect) for all devices listed above with the exception of the PIC18F4450, PIC18F4455, PIC18F4458 and the PIC18F4553 devices (see **Section 2.8 "Dedicated ICSP/ICD Port (44-Pin TQFP Only)"** for more information on programming these pins in these devices).

For PIC18F2685/4685 devices, the code memory space extends from 0000h to 017FFFh (96 Kbytes) in five 16-Kbyte blocks. For PIC18F2682/4682 devices, the code memory space extends from 0000h to 0013FFFh (80 Kbytes) in four 16-Kbyte blocks. Addresses, 0000h through 0FFFh, however, define a “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

The size of the Boot Block in PIC18F2685/4685 and PIC18F2682/4682 devices can be configured as 1, 2 or 4K words (see Figure 2-7). This is done through the BBSIZ<2:1> bits in the Configuration register, CONFIG4L. It is important to note that increasing the size of the Boot Block decreases the size of Block 0.

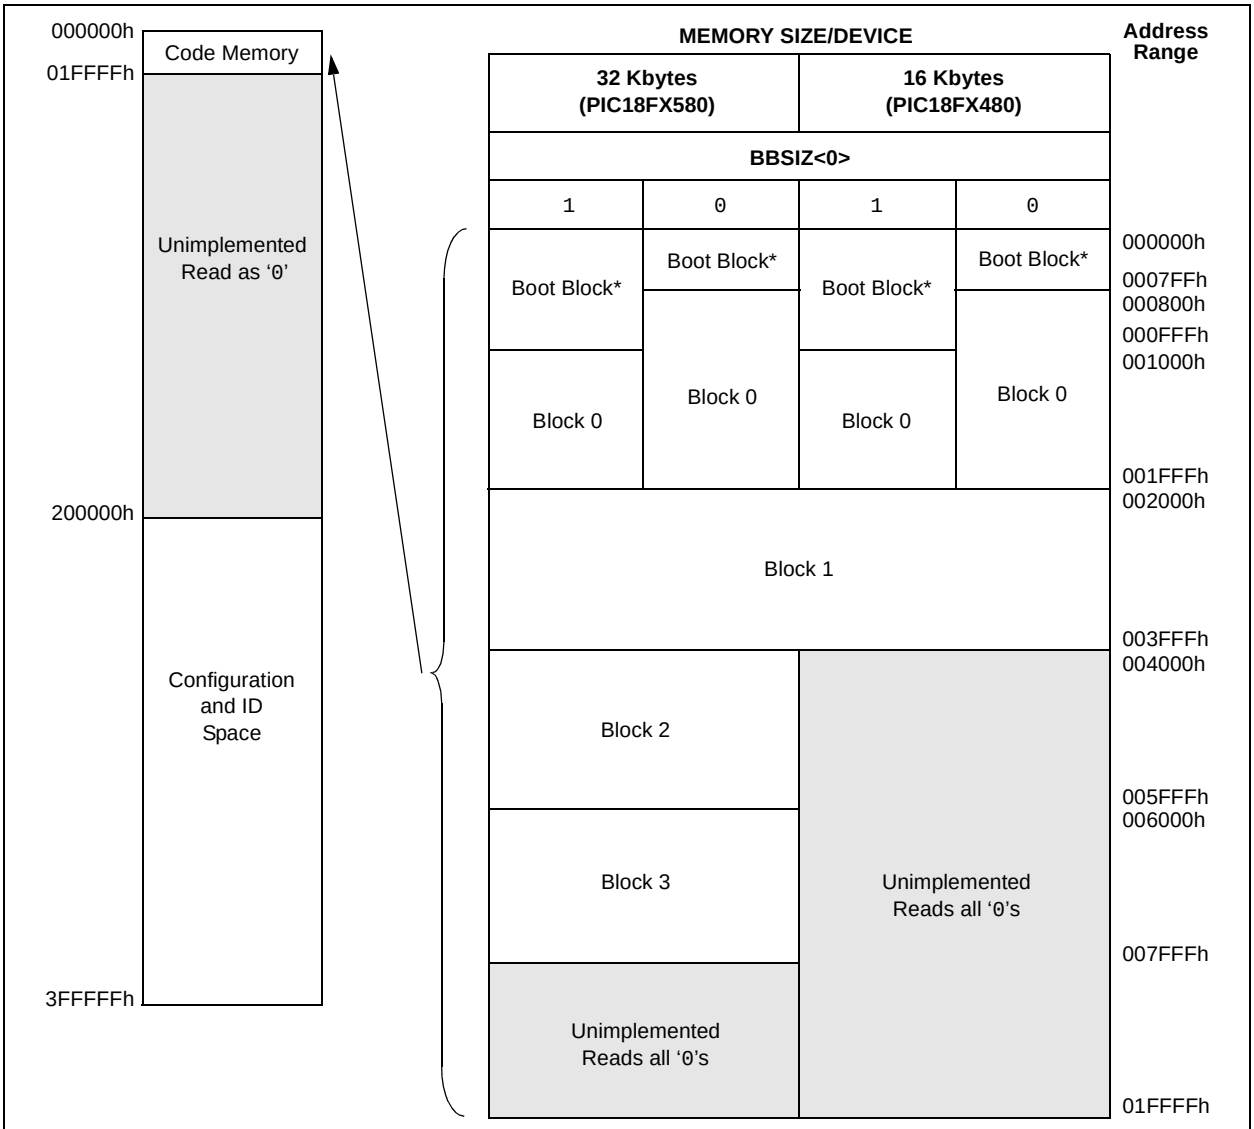
TABLE 2-3: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2682	000000h-013FFFh (80K)
PIC18F4682	
PIC18F2685	000000h-017FFFh (96K)
PIC18F4685	

TABLE 2-6: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F2480	000000h-003FFFh (16K)
PIC18F4480	
PIC18F2580	000000h-007FFFh (32K)
PIC18F4580	

FIGURE 2-10: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18F2480/2580/4480/4580 DEVICES



Note: Sizes of memory areas are not to scale.

* Boot Block size is determined by the BBSIZ<0> bit in the CONFIG4L register.

For PIC18F2221/4221 devices, the code memory space extends from 0000h to 00FFFh (4 Kbytes) in one 4-Kbyte block. For PIC18F2321/4321 devices, the code memory space extends from 0000h to 01FFFh (8 Kbytes) in two 4-Kbyte blocks. Addresses, 0000h through 07FFh, however, define a variable “Boot Block” region that is treated separately from Block 0. All of these blocks define code protection boundaries within the code memory space.

2.5 Entering and Exiting High-Voltage ICSP Program/Verify Mode

As shown in Figure 2-14, the High-Voltage ICSP Program/Verify mode is entered by holding PGC and PGD low and then raising $\overline{MCLR}$/VPP/RE3 to VIHH (high voltage). Once in this mode, the code memory, data EEPROM (selected devices only, see **Section 3.3 "Data EEPROM Programming"**), ID locations and Configuration bits can be accessed and programmed in serial fashion. Figure 2-15 shows the exit sequence.

The sequence that enters the device into the Program/Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-14: ENTERING HIGH-VOLTAGE PROGRAM/VERIFY MODE

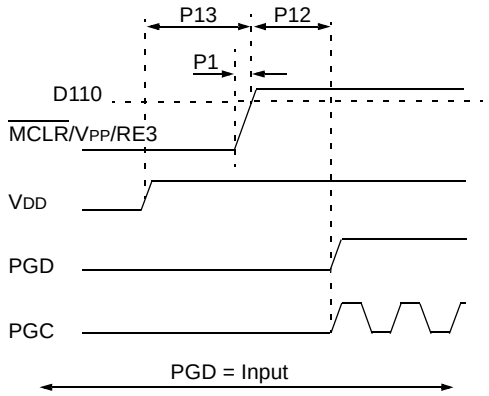


FIGURE 2-15: EXITING HIGH-VOLTAGE PROGRAM/VERIFY MODE

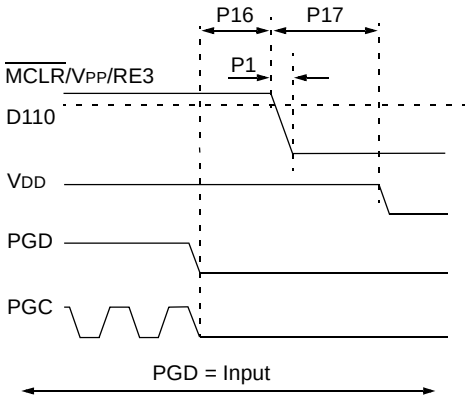


2.7 Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.7.1 4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-8.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-9. The 4-bit command is shown Most Significant bit (MSb) first. The command operand, or “Data Payload”, is shown as <MSB><LSB>. Figure 2-18 demonstrates how to serially present a 20-bit command/operand to the device.

2.7.2 CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to set up registers as appropriate for use with other commands.

TABLE 2-8: COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in16-bit instruction)	0000
Shift Out TABLAT Register	0010
Table Read	1000
Table Read, Post-Increment	1001
Table Read, Post-Decrement	1010
Table Read, Pre-Increment	1011
Table Write	1100
Table Write, Post-Increment by 2	1101
Table Write, Start Programming, Post-Increment by 2	1110
Table Write, Start Programming	1111

TABLE 2-9: SAMPLE COMMAND SEQUENCE

4-Bit Command	Data Payload	Core Instruction
1101	3C 40	Table Write, post-increment by 2

3.0 DEVICE PROGRAMMING

Programming includes the ability to erase or write the various memory regions within the device.

In all cases, except high-voltage ICSP Bulk Erase, the EECON1 register must be configured in order to operate on a particular memory region.

When using the EECON1 register to act on code memory, the EEPGD bit must be set (EECON1<7> = 1) and the CFGS bit must be cleared (EECON1<6> = 0). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort (e.g., erases) and this must be done prior to initiating a write sequence. The FREE bit must be set (EECON1<4> = 1) in order to erase the program space being pointed to by the Table Pointer. The erase or write sequence is initiated by setting the WR bit (EECON1<1> = 1). It is strongly recommended that the WREN bit only be set immediately prior to a program erase.

3.1 ICSP Erase

3.1.1 HIGH-VOLTAGE ICSP BULK ERASE

Erasing code or data EEPROM is accomplished by configuring two Bulk Erase Control registers located at 3C0004h and 3C0005h. Code memory may be erased, portions at a time, or the user may erase the entire device in one action. Bulk Erase operations will also clear any code-protect settings associated with the memory block being erased. Erase options are detailed in Table 3-1. If data EEPROM is code-protected (CPD = 0), the user must request an erase of data EEPROM (e.g., 0084h as shown in Table 3-1).

TABLE 3-1: BULK ERASE OPTIONS

Description	Data (3C0005h:3C0004h)
Chip Erase	3F8Fh
Erase Data EEPROM(1)	0084h
Erase Boot Block	0081h
Erase Configuration Bits	0082h
Erase Code EEPROM Block 0	0180h
Erase Code EEPROM Block 1	0280h
Erase Code EEPROM Block 2	0480h
Erase Code EEPROM Block 3	0880h
Erase Code EEPROM Block 4	1080h
Erase Code EEPROM Block 5	2080h

Note 1: Selected devices only, see **Section 3.3 “Data EEPROM Programming”**.

The actual Bulk Erase function is a self-timed operation. Once the erase has started (falling edge of the 4th PGC after the NOP command), serial execution will cease until the erase completes (Parameter P11). During this time, PGC may continue to toggle but PGD must be held low.

The code sequence to erase the entire device is shown in Table and the flowchart is shown in Figure 3-1.

Note: A Bulk Erase is the only way to reprogram code-protect bits from an ON state to an OFF state.

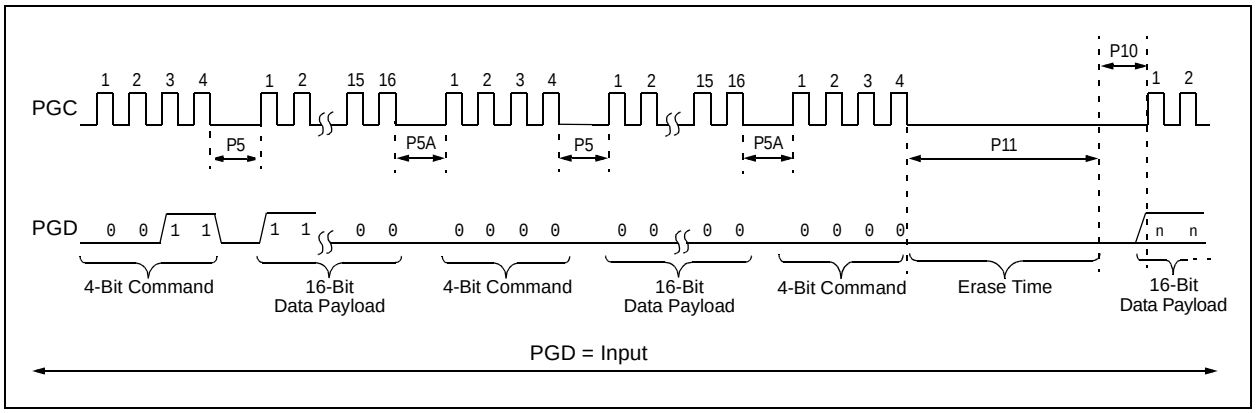
3.1.2 LOW-VOLTAGE ICSP BULK ERASE

When using low-voltage ICSP, the part must be supplied by the voltage specified in Parameter D111 if a Bulk Erase is to be executed. All other Bulk Erase details, as described above, apply.

If it is determined that a program memory erase must be performed at a supply voltage below the Bulk Erase limit, refer to the erase methodology described in **Section 3.1.3 "ICSP Row Erase"** and **Section 3.2.1 "Modifying Code Memory"**.

If it is determined that a data EEPROM erase (selected devices only, see **Section 3.3 "Data EEPROM Programming"**) must be performed at a supply voltage below the Bulk Erase limit, follow the methodology described in **Section 3.3 "Data EEPROM Programming"** and write '1's to the array.

FIGURE 3-2: BULK ERASE TIMING



3.1.3 ICSP ROW ERASE

Regardless of whether high or low-voltage ICSP is used, it is possible to erase one row (64 bytes of data), provided the block is not code or write-protected. Rows are located at static boundaries, beginning at program memory address, 000000h, extending to the internal program memory limit (see **Section 2.3 "Memory Maps"**).

The Row Erase duration is externally timed and is controlled by PGC. After the WR bit in EECON1 is set, a NOP is issued, where the 4th PGC is held high for the duration of the programming time, P9.

After PGC is brought low, the programming sequence is terminated. PGC must be held low for the time specified by Parameter P10 to allow high-voltage discharge of the memory array.

The code sequence to Row Erase a PIC18F2XXX/4XXX Family device is shown in Table 3-3. The flowchart, shown in Figure 3-3, depicts the logic necessary to completely erase a PIC18F2XXX/4XXX Family device. The timing diagram that details the Start Programming command and Parameters P9 and P10 is shown in Figure 3-5.

Note:	The TBLPTR register can point to any byte within the row intended for erase.

3.2 Code Memory Programming

Programming code memory is accomplished by first loading data into the write buffer and then initiating a programming sequence. The write and erase buffer sizes, shown in Table 3-4, can be mapped to any location of the same size, beginning at 000000h. The actual memory write sequence takes the contents of this buffer and programs the proper amount of code memory that contains the Table Pointer.

The programming duration is externally timed and is controlled by PGC. After a Start Programming command is issued (4-bit command, '1111'), a NOP is issued, where the 4th PGC is held high for the duration of the programming time, P9.

After PGC is brought low, the programming sequence is terminated. PGC must be held low for the time specified by Parameter P10 to allow high-voltage discharge of the memory array.

The code sequence to program a PIC18F2XXX/4XXX Family device is shown in Table 3-5. The flowchart, shown in Figure 3-4, depicts the logic necessary to completely write a PIC18F2XXX/4XXX Family device. The timing diagram that details the Start Programming command and Parameters P9 and P10 is shown in Figure 3-5.

Note:	The TBLPTR register must point to the same region when initiating the programming sequence as it did when the write buffers were loaded.

TABLE 3-4: WRITE AND ERASE BUFFER SIZES

Devices (Arranged by Family)	Write Buffer Size (Bytes)	Erase Buffer Size (Bytes)
PIC18F2221, PIC18F2321, PIC18F4221, PIC18F4321	8	64
PIC18F2450, PIC18F4450	16	64
PIC18F2410, PIC18F2510, PIC18F4410, PIC18F4510	32	64
PIC18F2420, PIC18F2520, PIC18F4420, PIC18F4520		
PIC18F2423, PIC18F2523, PIC18F4423, PIC18F4523		
PIC18F2480, PIC18F2580, PIC18F4480, PIC18F4580		
PIC18F2455, PIC18F2550, PIC18F4455, PIC18F4550		
PIC18F2458, PIC18F2553, PIC18F4458, PIC18F4553		
PIC18F2515, PIC18F2610, PIC18F4515, PIC18F4610	64	64
PIC18F2525, PIC18F2620, PIC18F4525, PIC18F4620		
PIC18F2585, PIC18F2680, PIC18F4585, PIC18F4680		
PIC18F2682, PIC18F2685, PIC18F4682, PIC18F4685		

3.2.1 MODIFYING CODE MEMORY

The previous programming example assumed that the device had been Bulk Erased prior to programming (see **Section 3.1.1 "High-Voltage ICSP Bulk Erase"**). It may be the case, however, that the user wishes to modify only a section of an already programmed device.

The appropriate number of bytes required for the erase buffer must be read out of code memory (as described in **Section 4.2 "Verify Code Memory and ID Locations"**) and buffered. Modifications can be made on this buffer. Then, the block of code memory that was read out must be erased and rewritten with the modified data.

The WREN bit must be set if the WR bit in EECON1 is used to initiate a write sequence.

TABLE 3-6: MODIFYING CODE MEMORY

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory.		
Step 2: Read and modify code memory (see **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"**).		
0000 0000	8E A6 9C A6	BSF EECON1, EEPGD BCF EECON1, CFGS
Step 3: Set the Table Pointer for the block to be erased.		
0000 0000 0000 0000 0000 0000	0E <Addr[21:16]> 6E F8 0E <Addr[8:15]> 6E F7 0E <Addr[7:0]> 6E F6	MOVLW <Addr[21:16]> MOVWF TBLPTRU MOVLW <Addr[8:15]> MOVWF TBLPTRH MOVLW <Addr[7:0]> MOVWF TBLPTRL
Step 4: Enable memory writes and set up an erase.		
0000 0000	84 A6 88 A6	BSF EECON1, WREN BSF EECON1, FREE
Step 5: Initiate erase.		
0000 0000	82 A6 00 00	BSF EECON1, WR NOP - hold PGC high for time P9 and low for time P10.
Step 6: Load write buffer. The correct bytes will be selected based on the Table Pointer.		
0000 0000 0000 0000 0000 0000 1101 . . . 1111 0000	0E <Addr[21:16]> 6E F8 0E <Addr[8:15]> 6E F7 0E <Addr[7:0]> 6E F6 <MSB><LSB> . . . <MSB><LSB> 00 00	MOVLW <Addr[21:16]> MOVWF TBLPTRU MOVLW <Addr[8:15]> MOVWF TBLPTRH MOVLW <Addr[7:0]> MOVWF TBLPTRL Write 2 bytes and post-increment address by 2. Repeat as many times as necessary to fill the write buffer Write 2 bytes and start programming. NOP - hold PGC high for time P9 and low for time P10.
To continue modifying data, repeat Steps 2 through 6, where the Address Pointer is incremented by the appropriate number of bytes (see Table 3-4) at each iteration of the loop. The write cycle must be repeated enough times to completely rewrite the contents of the erase buffer.		
Step 7: Disable writes.		
0000	94 A6	BCF EECON1, WREN

3.3 Data EEPROM Programming

Note: Data EEPROM programming is **not** available on the following devices:	
PIC18F2410	PIC18F4410
PIC18F2450	PIC18F4450
PIC18F2510	PIC18F4510
PIC18F2515	PIC18F4515
PIC18F2610	PIC18F4610

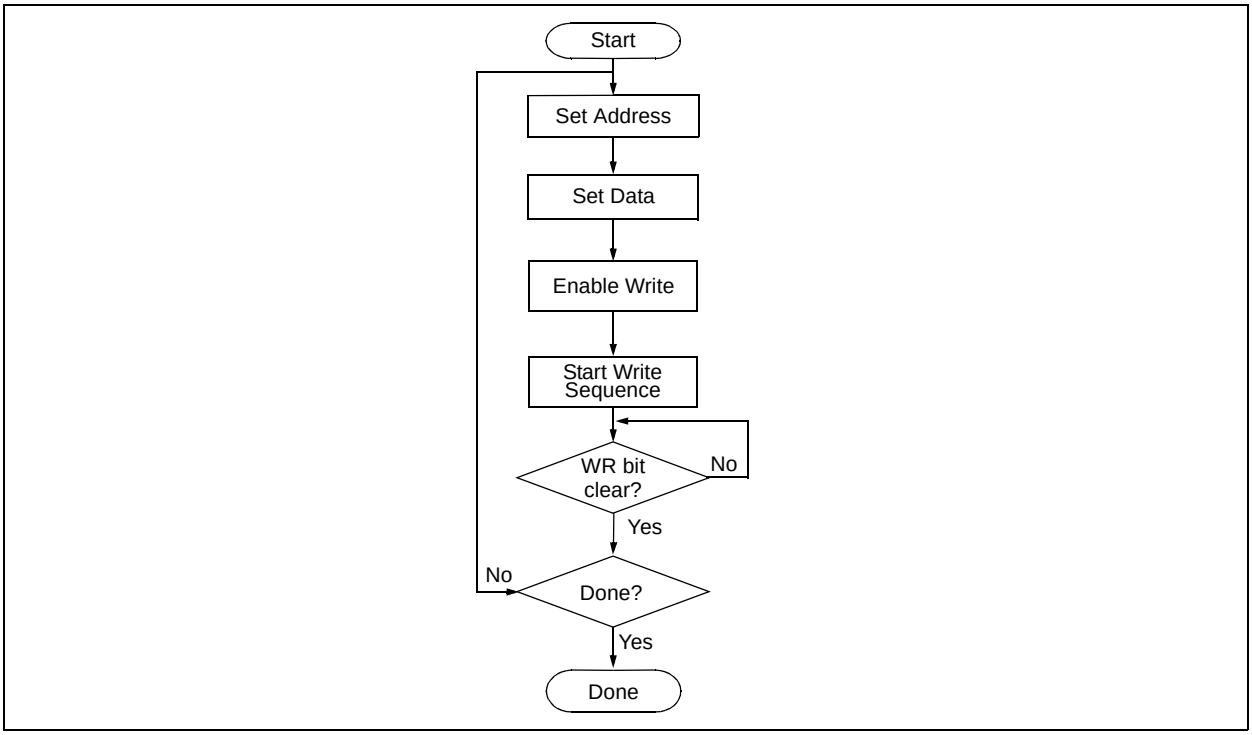
Data EEPROM is accessed one byte at a time via an Address Pointer (register pair: EEADRH:EEADR) and a data latch (EEDATA). Data EEPROM is written by loading EEADRH:EEADR with the desired memory location, EEDATA, with the data to be written and initiating a memory write by appropriately configuring the EECON1 register. A byte write automatically erases the location and writes the new data (erase-before-write).

When using the EECON1 register to perform a data EEPROM write, both the EEPGD and CFGS bits must be cleared (EECON1<7:6> = 00). The WREN bit must be set (EECON1<2> = 1) to enable writes of any sort and this must be done prior to initiating a write sequence. The write sequence is initiated by setting the WR bit (EECON1<1> = 1).

The write begins on the falling edge of the 4th PGC after the WR bit is set. It ends when the WR bit is cleared by hardware.

After the programming sequence terminates, PGC must still be held low for the time specified by Parameter P10 to allow high-voltage discharge of the memory array.

FIGURE 3-6: PROGRAM DATA FLOW



4.0 READING THE DEVICE

4.1 Read Code Memory, ID Locations and Configuration Bits

Code memory is accessed, one byte at a time, via the 4-bit command, '1001' (Table Read, post-increment). The contents of memory pointed to by the Table Pointer (TBLPTRU:TBLPTRH:TBLPTRL) are serially output on PGD.

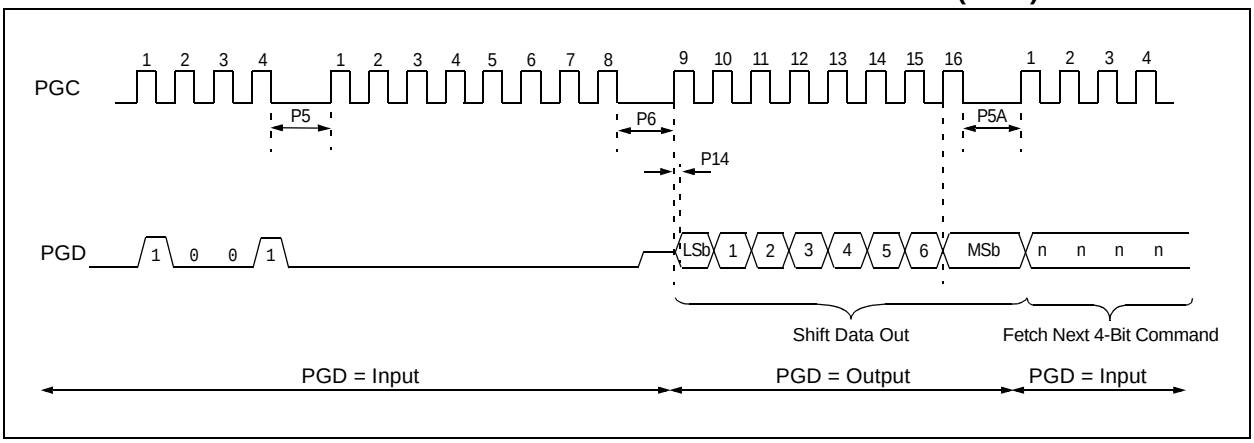
The 4-bit command is shifted in, LSb first. The read is executed during the next eight clocks, then shifted out on PGD during the last eight clocks, LSb to MSb. A delay of P6 must be introduced after the falling edge of the 8th PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-1). This operation also increments the Table Pointer by one, pointing to the next byte in code memory for the next read.

This technique will work to read any memory in the 000000h to 3FFFFFh address space, so it also applies to the reading of the ID and Configuration registers.

TABLE 4-1: READ CODE MEMORY SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Set Table Pointer.		
0000	0E <Addr[21:16]>	MOVLW Addr[21:16]
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[15:8]>	MOVLW <Addr[15:8]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
Step 2: Read memory and then shift out on PGD, LSb to MSb.		
1001	00 00	TBLRD *+

FIGURE 4-1: TABLE READ POST-INCREMENT INSTRUCTION TIMING (1001)



5.0 CONFIGURATION WORD

The PIC18F2XXX/4XXX Family devices have several Configuration Words. These bits can be set or cleared to select various device configurations. All other memory areas should be programmed and verified prior to setting the Configuration Words. These bits may be read out normally, even after read or code protection. See Table 5-1 for a list of Configuration bits and Device IDs, and Table 5-3 for the Configuration bit descriptions.

5.1 ID Locations

A user may store identification information (ID) in eight ID locations, mapped in 200000h:200007h. It is recommended that the Most Significant nibble of each ID be Fh. In doing so, if the user code inadvertently tries to execute from the ID space, the ID data will execute as a NOP.

5.2 Device ID Word

The Device ID Word for the PIC18F2XXX/4XXX Family devices is located at 3FFFFEh:3FFFFFh. These bits may be used by the programmer to identify what device type is being programmed and read out normally, even after code or read protection.

In some cases, devices may share the same DEVID values. In such cases, the Most Significant bit of the device revision, REV4 (DEVID1<4>), will need to be examined to completely determine the device being accessed.

See Table 5-2 for a complete list of Device ID values.

FIGURE 5-1: READ DEVICE ID WORD FLOW

Legend: The 'x's in DEVID1 contain the device revision code.
Note 1: DEVID1 bit 4 is used to determine the device type (REV4 = 0).
2: DEVID1 bit 4 is used to determine the device type (REV4 = 1).

5.6.3 ID LOCATIONS

Normally, the contents of these locations are defined by the user, but MPLAB® IDE provides the option of writing the device's unprotected 16-bit checksum in the 16 Most Significant bits of the ID locations (see MPLAB IDE Configure/ID Memory" menu). The lower 16 bits are not used and remain clear. This is the sum of all program memory contents and Configuration Words (appropriately masked) before any code protection is enabled.

If the user elects to define the contents of the ID locations, nothing about protected blocks can be known. If the user uses the preprotected checksum, provided by MPLAB IDE, an indirect characteristic of the programmed code is provided.

5.6.4 CODE PROTECTION

Blocks that are code-protected read back as all '0's and have no effect on checksum calculations. If any block is code-protected, then the contents of the ID locations are included in the checksum calculation.

All Configuration Words and the ID locations can always be read out normally, even when the device is fully code-protected. Checking the code protection settings in Configuration Words can direct which, if any, of the program memory blocks can be read, and if the ID locations should be used for checksum calculations.

TABLE 5-4: DEVICE BLOCK LOCATIONS AND SIZES

Device	Memory Size (Bytes)	Pins	Ending Address							Size (Bytes)			
			Boot Block	Block 0	Block 1	Block 2	Block 3	Block 4	Block 5	Boot Block	Block 0	Remaining Blocks	Device Total
PIC18F2221	4K	28	0001FF	0007FF	000FFF	—	—	—	—	512	1536	2048	4096
