Welcome to E-XFL.COM

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details	
Product Status	Active
Architecture	MCU, FPGA
Core Processor	Quad ARM® Cortex®-A53 MPCore™ with CoreSight™
Flash Size	-
RAM Size	256KB
Peripherals	DMA, WDT
Connectivity	EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	1.5GHz
Primary Attributes	FPGA - 2800K Logic Elements
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1760-BBGA, FCBGA
Supplier Device Package	1760-FBGA, FC (42.5x42.5)
Purchase URL	https://www.e-xfl.com/product-detail/intel/1sx280ln2f43i1vg

Common to all Intel Stratix 10 family variants is a high-performance fabric based on the new HyperFlex core architecture that includes additional Hyper-Registers throughout the interconnect routing and at the inputs of all functional blocks. The core fabric also contains an enhanced logic array utilizing Intel's adaptive logic module (ALM) and a rich set of high performance building blocks including:

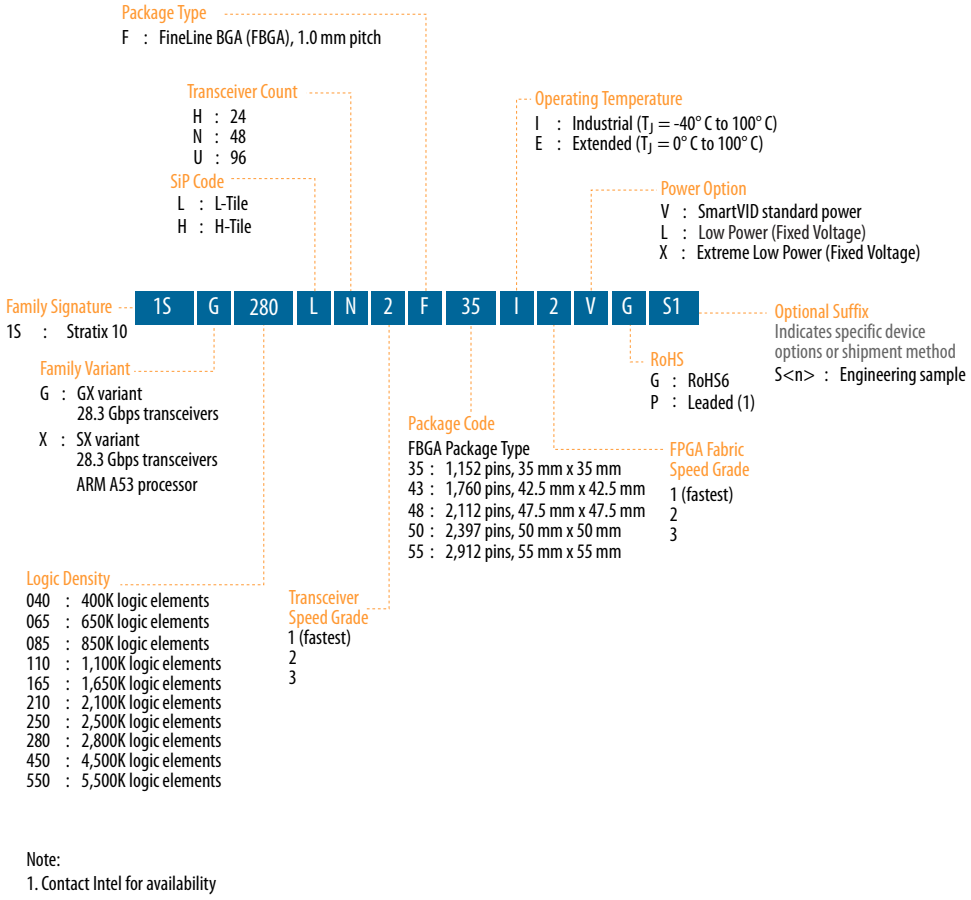
- M20K (20 kbit) embedded memory blocks
- Variable precision DSP blocks with hard IEEE 754 compliant floating-point units
- Fractional synthesis and integer PLLs
- Hard memory controllers and PHY for external memory interfaces
- General purpose IO cells

To clock these building blocks, Intel Stratix 10 devices use programmable clock tree synthesis, which uses dedicated clock tree routing to synthesize only those branches of the clock trees required for the application. All devices support in-system, fine-grained partial reconfiguration of the logic array, allowing logic to be added and subtracted from the system while it is operating.

All family variants also contain high speed serial transceivers, containing both the physical medium attachment (PMA) and the physical coding sublayer (PCS), which can be used to implement a variety of industry standard and proprietary protocols. In addition to the hard PCS, Intel Stratix 10 devices contain multiple instantiations of PCI Express hard IP that supports Gen1/Gen2/Gen3 rates in x1/x2/x4/x8/x16 lane configurations, and hard 10GBASE-KR/40GBASE-KR4 FEC for every transceiver. The hard PCS, FEC, and PCI Express IP free up valuable core logic resources, save power, and increase your productivity.

1.1.1. Available Options

Figure 1. Sample Ordering Code and Available Options for Intel Stratix 10 Devices



1.2. Innovations in Intel Stratix 10 FPGAs and SoCs

Intel Stratix 10 FPGAs and SoCs deliver many significant improvements over the previous generation high-performance Stratix V FPGAs.

Table 1. Key Features of Intel Stratix 10 Devices Compared to Stratix V Devices

Feature	Stratix V FPGAs	Intel Stratix 10 FPGAs and SoCs
Process technology	28-nm TSMC (planar transistor)	14 nm Intel Tri-Gate (FinFET)
Hard processor core	None	Quad-core 64-bit ARM Cortex-A53 (SoC only)
Core architecture	Conventional core architecture with conventional interconnect	HyperFlex core architecture with Hyper-Registers in the interconnect
Core performance	500 MHz	1 GHz
Power dissipation	1x	As low as 0.3x

continued...

- **Additional Hard IP**: Intel Stratix 10 devices include many more hard IP blocks than previous generation devices, with a hard memory controller included in each bank of 48 general purpose IOs, a hard PCIe Gen3 x16 full protocol stack in each transceiver tile, and a hard 10GBASE-KR/40GBASE-KR4 FEC in every transceiver channel
- **Enhanced Core Clocking**: Intel Stratix 10 devices feature programmable clock tree synthesis; clock trees are only synthesized where needed, increasing the flexibility and reducing the power dissipation of the clocking solution
- **Additional Core PLLs**: The core fabric in Intel Stratix 10 devices is supported by both integer IO PLLs and fractional synthesis fPLLs, resulting in a greater total number of PLLs available than the previous generation

1.3. FPGA and SoC Features Summary

Table 2. Intel Stratix 10 FPGA and SoC Common Device Features

Feature	Description
Technology	• 14-nm Intel Tri-Gate (FinFET) process technology • SmartVID controlled core voltage, standard power devices • 0.85-V fixed core voltage, low static power devices available
Low power serial transceivers	• Up to 96 total transceivers available • Continuous operating range of 1 Gbps to 28.3 Gbps for Intel Stratix 10 GX/SX devices • Backplane support up to 28.3 Gbps for Intel Stratix 10 GX/SX devices • Extended range down to 125 Mbps with oversampling • ATX transmit PLLs with user-configurable fractional synthesis capability • XFP, SFP+, QSFP/QSFP28, CFP/CFP2/CFP4 optical module support • Adaptive linear and decision feedback equalization • Transmit pre-emphasis and de-emphasis • Dynamic partial reconfiguration of individual transceiver channels • On-chip instrumentation (Eye Viewer non-intrusive data eye monitoring)
General purpose I/Os	• Up to 1640 total GPIO available • 1.6 Gbps LVDS—every pair can be configured as an input or output • 1333 MHz/2666 Mbps DDR4 external memory interface • 1067 MHz/2133 Mbps DDR3 external memory interface • 1.2 V to 3.0 V single-ended LVCMOS/LVTTL interfacing • On-chip termination (OCT)
Embedded hard IP	• PCIe Gen1/Gen2/Gen3 complete protocol stack, x1/x2/x4/x8/x16 end point and root port • DDR4/DDR3/LPDDR3 hard memory controller (RLDRAM3/QDR II+/QDR IV using soft memory controller) • Multiple hard IP instantiations in each device • Single Root I/O Virtualization (SR-IOV)
Transceiver hard IP	• 10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC) • 10G Ethernet PCS • PCI Express PIPE interface • Interlaken PCS • Gigabit Ethernet PCS • Deterministic latency support for Common Public Radio Interface (CPRI) PCS • Fast lock-time support for Gigabit Passive Optical Networking (GPON) PCS • 8B/10B, 64B/66B, 64B/67B encoders and decoders • Custom mode support for proprietary protocols

continued...

Feature	Description
Power management	• SmartVID controlled core voltage, standard power devices • 0.85-V fixed core voltage, low static power devices available • Intel Quartus® Prime Pro Edition integrated power analysis
High performance monolithic core fabric	• HyperFlex core architecture with Hyper-Registers throughout the interconnect routing and at the inputs of all functional blocks • Monolithic fabric minimizes compile times and increases logic utilization • Enhanced adaptive logic module (ALM) • Improved multi-track routing architecture reduces congestion and improves compile times • Hierarchical core clocking architecture with programmable clock tree synthesis • Fine-grained partial reconfiguration
Internal memory blocks	• M20K—20-Kbit with hard ECC support • MLAB—640-bit distributed LUTRAM
Variable precision DSP blocks	• IEEE 754-compliant hard single-precision floating point capability • Supports signal processing with precision ranging from 18x19 up to 54x54 • Native 27x27 and 18x19 multiply modes • 64-bit accumulator and cascade for systolic FIRs • Internal coefficient memory banks • Pre-adder/subtractor improves efficiency • Additional pipeline register increases performance and reduces power
Phase locked loops (PLL)	• Fractional synthesis PLLs (fPLL) support both fractional and integer modes • Fractional mode with third-order delta-sigma modulation • Precision frequency synthesis • Integer PLLs adjacent to general purpose I/Os, support external memory, and LVDS interfaces, clock delay compensation, zero delay buffering
Core clock networks	• 1 GHz fabric clocking • 667 MHz external memory interface clocking, supports 2666 Mbps DDR4 interface • 800 MHz LVDS interface clocking, supports 1600 Mbps LVDS interface • Programmable clock tree synthesis, backwards compatible with global, regional and peripheral clock networks • Clocks only synthesized where needed, to minimize dynamic power

continued...

SoC Subsystem	Feature	Description
	NAND flash controller	• 1 ONFI 1.0, 8- and 16-bit support
	General-purpose I/O (GPIO)	• Maximum of 48 software programmable GPIO
	Timers	• 4 general-purpose timers • 4 watchdog timers
Secure Device Manager	Security	• Secure boot • Advanced Encryption Standard (AES) and authentication (SHA/ECDSA)
External Memory Interface	External Memory Interface	• Hard Memory Controller with DDR4 and DDR3, and LPDDR3

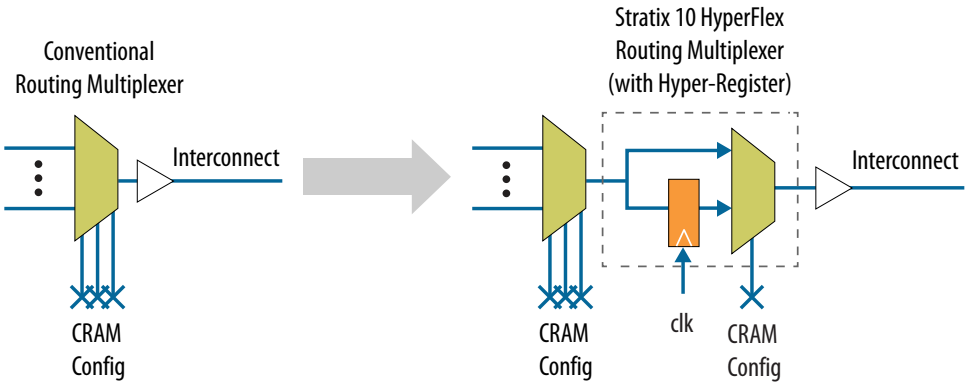
1.6. HyperFlex Core Architecture

Intel Stratix 10 FPGAs and SoCs are based on a monolithic core fabric featuring the new HyperFlex core architecture. The HyperFlex core architecture delivers 2X the clock frequency performance and up to 70% lower power compared to previous generation high-end FPGAs. Along with this performance breakthrough, the HyperFlex core architecture delivers a number of advantages including:

- **Higher Throughput**—Leverages 2X core clock frequency performance to obtain throughput breakthroughs
- **Improved Power Efficiency**—Uses reduced IP size, enabled by HyperFlex, to consolidate designs which previously spanned multiple devices into a single device, thereby reducing power by up to 70% versus previous generation devices
- **Greater Design Functionality**—Uses faster clock frequency to reduce bus widths and reduce IP size, freeing up additional FPGA resources to add greater functionality
- **Increased Designer Productivity**—Boosts performance with less routing congestion and fewer design iterations using Hyper-Aware design tools, obtaining greater timing margin for more rapid timing closure

In addition to the traditional user registers found in the Adaptive Logic Modules (ALM), the HyperFlex core architecture introduces additional bypassable registers everywhere throughout the fabric of the FPGA. These additional registers, called Hyper-Registers are available on every interconnect routing segment and at the inputs of all functional blocks.

Figure 3. Bypassable Hyper-Register

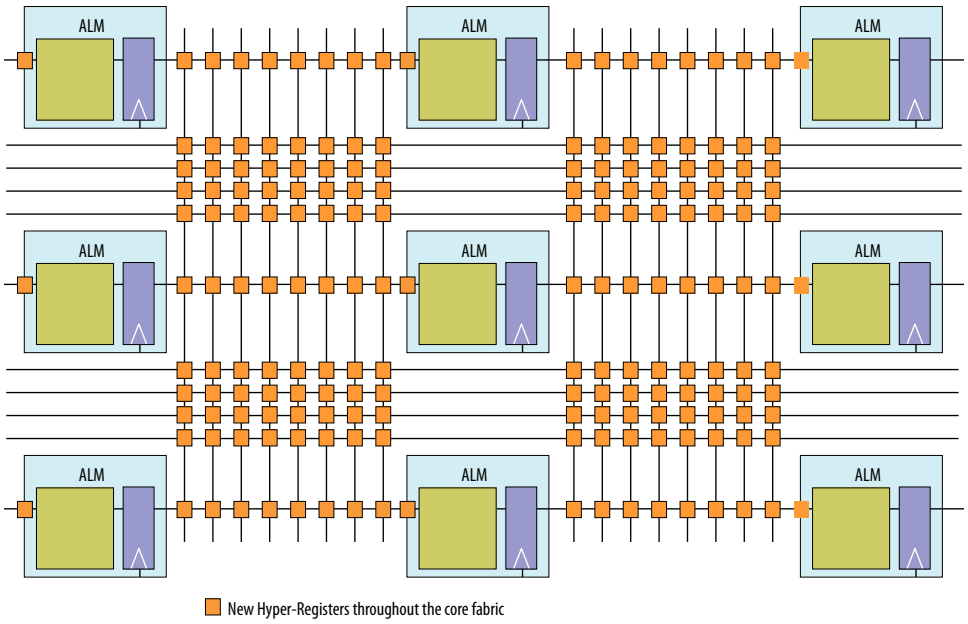


The Hyper-Registers enable the following key design techniques to achieve the 2X core performance increases:

- Fine grain Hyper-Retiming to eliminate critical paths
- Zero latency Hyper-Pipelining to eliminate routing delays
- Flexible Hyper-Optimization for best-in-class performance

By implementing these techniques in your design, the Hyper-Aware design tools automatically make use of the Hyper-Registers to achieve maximum core clock frequency.

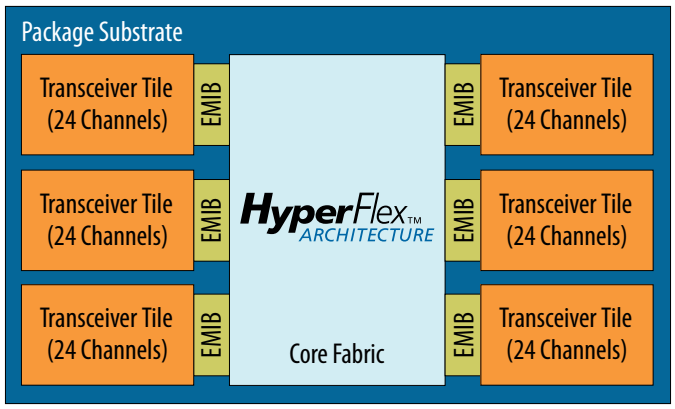
Figure 4. HyperFlex Core Architecture



1.7. Heterogeneous 3D SiP Transceiver Tiles

Intel Stratix 10 FPGAs and SoCs feature power efficient, high bandwidth, low latency transceivers. The transceivers are implemented on heterogeneous 3D System-in-Package (SiP) transceiver tiles, each containing 24 full-duplex transceiver channels. In addition to providing a high-performance transceiver solution to meet current connectivity needs, this allows for future flexibility and scalability as data rates, modulation schemes, and protocol IPs evolve.

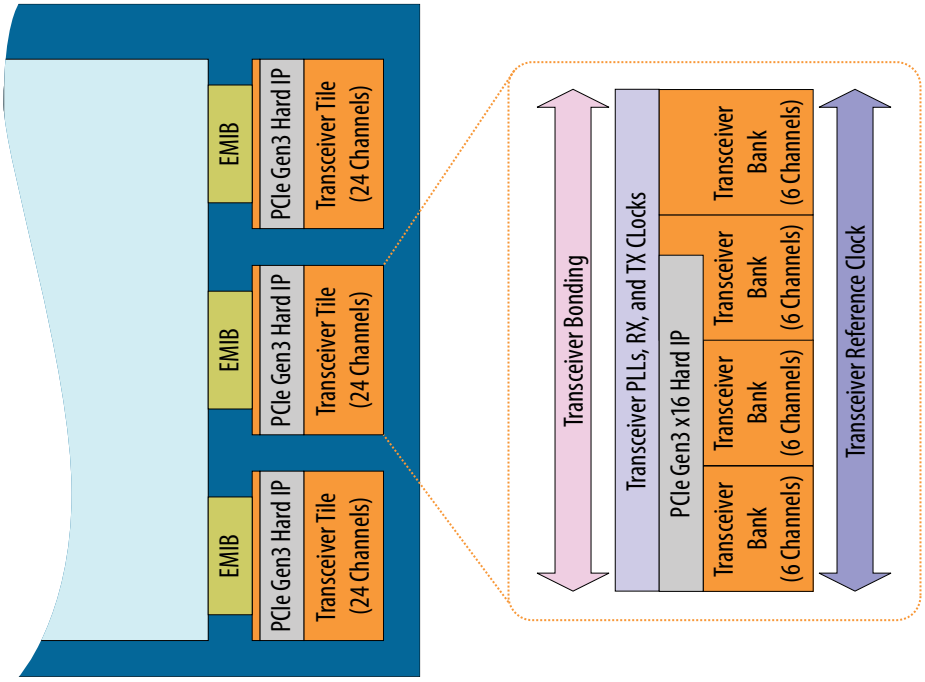
Figure 5. Monolithic Core Fabric and Heterogeneous 3D SiP Transceiver Tiles



Each transceiver tile contains:

- 24 full-duplex transceiver channels (PMA and PCS)
- Reference clock distribution network
- Transmit PLLs
- High-speed clocking and bonding networks
- One instance of PCI Express hard IP

Figure 6. Heterogeneous 3D SiP Transceiver Tile Architecture



1.8. Intel Stratix 10 Transceivers

Intel Stratix 10 devices offer up to 96 total full-duplex transceiver channels. These channels provide continuous data rates from 1 Gbps to 28.3 Gbps for chip-to-chip, chip-to-module, and backplane applications. In each device,two thirds of the transceivers can be configured up to the maximum data rate of 28.3 Gbps to drive 100G interfaces and C form-factor pluggable CFP2/CFP4 optical modules. For longer-reach backplane driving applications, advanced adaptive equalization circuits are used to equalize over 30 dB of system loss.

All transceiver channels feature a dedicated Physical Medium Attachment (PMA) and a hardened Physical Coding Sublayer (PCS).

- The PMA provides primary interfacing capabilities to physical channels.
- The PCS typically handles encoding/decoding, word alignment, and other pre-processing functions before transferring data to the FPGA core fabric.

Within each transceiver tile, the transceivers are arranged in four banks of six PMA-PCS groups. A wide variety of bonded and non-bonded data rate configurations are possible within each bank, and within each tile, using a highly configurable clock distribution network.

1.8.1. PMA Features

PMA channels are comprised of transmitter (TX), receiver (RX), and high speed clocking resources.

Intel Stratix 10 device features provide exceptional signal integrity at data rates up to 28.3 Gbps. Clocking options include ultra-low jitter LC tank-based (ATX) PLLs with optional fractional synthesis capability, channel PLLs operating as clock multiplier units (CMUs), and fractional synthesis PLLs (fPLLs).

- **ATX PLL**—can be configured in integer mode, or optionally, in a new fractional synthesis mode. Each ATX PLL spans the full frequency range of the supported data rate range providing a stable, flexible clock source with the lowest jitter.
- **CMU PLL**—when not being used as a transceiver, select PMA channels can be configured as channel PLLs operating as CMUs to provide an additional master clock source within the transceiver bank.
- **fPLL**—In addition, dedicated fPLLs are available with precision frequency synthesis capabilities. fPLLs can be used to synthesize multiple clock frequencies from a single reference clock source and replace multiple reference oscillators for multi-protocol and multi-rate applications.

On the receiver side, each PMA has an independent channel PLL that allows analog tracking for clock-data recovery. Each PMA also has advanced equalization circuits that compensate for transmission losses across a wide frequency spectrum.

- **Variable Gain Amplifier (VGA)**—to optimize the receiver's dynamic range
- **Continuous Time Linear Equalizer (CTLE)**—to compensate for channel losses with lowest power dissipation
- **Decision Feedback Equalizer (DFE)**—to provide additional equalization capability on backplanes even in the presence of crosstalk and reflections
- **On-Die Instrumentation (ODI)**—to provide on-chip eye monitoring capabilities (Eye Viewer). This capability helps to optimize link equalization parameters during board bring-up and supports in-system link diagnostics and equalization margin testing

Feature	Capability
Digitally Assisted Analog CDR	Superior jitter tolerance with fast lock time
On-Die Instrumentation—Eye Viewer and Jitter Margin Tool	Simplify board bring-up, debug, and diagnostics with non-intrusive, high-resolution eye monitoring (Eye Viewer). Also inject jitter from transmitter to test link margin in system.
Dynamic Reconfiguration	Allows for independent control of each transceiver channel Avalon memory-mapped interface for the most transceiver flexibility.
Multiple PCS-PMA and PCS-Core to FPGA fabric interface widths	8-, 10-, 16-, 20-, 32-, 40-, or 64-bit interface widths for flexibility of deserialization width, encoding, and reduced latency

1.8.2. PCS Features

Intel Stratix 10 PMA channels interface with core logic through configurable and bypassable PCS interface layers.

The PCS contains multiple gearbox implementations to decouple the PMA and PCS interface widths. This feature provides the flexibility to implement a wide range of applications with 8, 10, 16, 20, 32, 40, or 64-bit interface width between each transceiver and the core logic.

The PCS also contains hard IP to support a variety of standard and proprietary protocols across a wide range of data rates and encoding schemes. The Standard PCS mode provides support for 8B/10B encoded applications up to 12.5 Gbps. The Enhanced PCS mode supports 64B/66B and 64B/67B encoded applications up to 17.4 Gbps. The enhanced PCS mode also includes an integrated 10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC) circuit. For highly customized implementations, a PCS Direct mode provides an interface up to 64 bits wide to allow for custom encoding and support for data rates up to 28.3 Gbps.

For more information about the PCS-Core interface or the double rate transfer mode, refer to the *Intel Stratix 10 L- and H-Tile Transceiver PHY User Guide*, and the *Intel Stratix 10 E-Tile Transceiver PHY User Guide*.

Table 9. Transceiver PCS Features

PCS Protocol Support	Data Rate (Gbps)	Transmitter Data Path	Receiver Data Path
Standard PCS	1 to 12.5	Phase compensation FIFO, byte serializer, 8B/10B encoder, bit-slipper, channel bonding	Rate match FIFO, word-aligner, 8B/10B decoder, byte deserializer, byte ordering
PCI Express Gen1/Gen2 x1, x2, x4, x8, x16	2.5 and 5.0	Same as Standard PCS plus PIPE 2.0 interface to core	Same as Standard PCS plus PIPE 2.0 interface to core
PCI Express Gen3 x1, x2, x4, x8, x16	8.0	Phase compensation FIFO, byte serializer, encoder, scrambler, bit-slipper, gear box, channel bonding, and PIPE 3.0 interface to core, auto speed negotiation	Rate match FIFO (0-600 ppm mode), word-aligner, decoder, descrambler, phase compensation FIFO, block sync, byte deserializer, byte ordering, PIPE 3.0 interface to core, auto speed negotiation
CPRI	0.6144 to 9.8	Same as Standard PCS plus deterministic latency serialization	Same as Standard PCS plus deterministic latency deserialization

PCS Protocol Support	Data Rate (Gbps)	Transmitter Data Path	Receiver Data Path
Enhanced PCS	2.5 to 17.4	FIFO, channel bonding, bit-slipper, and gear box	FIFO, block sync, bit-slipper, and gear box
10GBASE-R	10.3125	FIFO, 64B/66B encoder, scrambler, FEC, and gear box	FIFO, 64B/66B decoder, descrambler, block sync, FEC, and gear box
Interlaken	4.9 to 17.4	FIFO, channel bonding, frame generator, CRC-32 generator, scrambler, disparity generator, bit-slipper, and gear box	FIFO, CRC-32 checker, frame sync, descrambler, disparity checker, block sync, and gear box
SFI-S/SFI-5.2	11.3	FIFO, channel bonding, bit-slipper, and gear box	FIFO, bit-slipper, and gear box
IEEE 1588	1.25 to 10.3125	FIFO (fixed latency), 64B/66B encoder, scrambler, and gear box	FIFO (fixed latency), 64B/66B decoder, descrambler, block sync, and gear box
SDI	up to 12.5	FIFO and gear box	FIFO, bit-slipper, and gear box
GigE	1.25	Same as Standard PCS plus GigE state machine	Same as Standard PCS plus GigE state machine
PCS Direct	up to 28.3	Custom	Custom

Related Information

Intel Stratix 10 L- and H-Tile Transceiver PHY User Guide

1.9. PCI Express Gen1/Gen2/Gen3 Hard IP

Intel Stratix 10 devices contain embedded PCI Express hard IP designed for performance, ease-of-use, increased functionality, and designer productivity.

The PCI Express hard IP consists of the PHY, Data Link, and Transaction layers. It also supports PCI Express Gen1/Gen2/Gen3 end point and root port, in x1/x2/x4/x8/x16 lane configurations. The PCI Express hard IP is capable of operating independently from the core logic (autonomous mode). This feature allows the PCI Express link to power up and complete link training in less than 100 ms, while the rest of the device is still in the process of being configured. The hard IP also provides added functionality, which makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.

The PCI Express hard IP has improved end-to-end data path protection using Error Checking and Correction (ECC). In addition, the hard IP supports configuration of the device via protocol (CvP) across the PCI Express bus at Gen1/Gen2/Gen3 rates.

1.10. Interlaken PCS Hard IP

Intel Stratix 10 devices have integrated Interlaken PCS hard IP supporting rates up to 17.4 Gbps per lane.

The Interlaken PCS hard IP is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which has demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS hard IP is present in every transceiver channel in Intel Stratix 10 devices.

The DSP blocks can be configured to support signal processing with precision ranging from 18x19 up to 54x54. A pipeline register has been added to increase the maximum operating frequency of the DSP block and reduce power consumption.

Figure 10. DSP Block: Standard Precision Fixed Point Mode

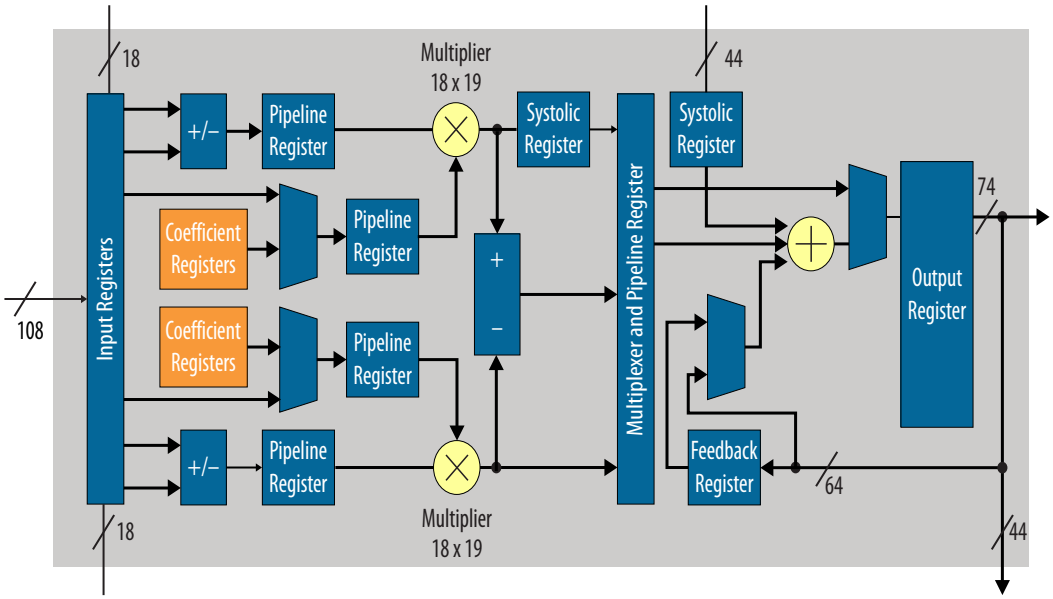

Figure 11. DSP Block: High Precision Fixed Point Mode

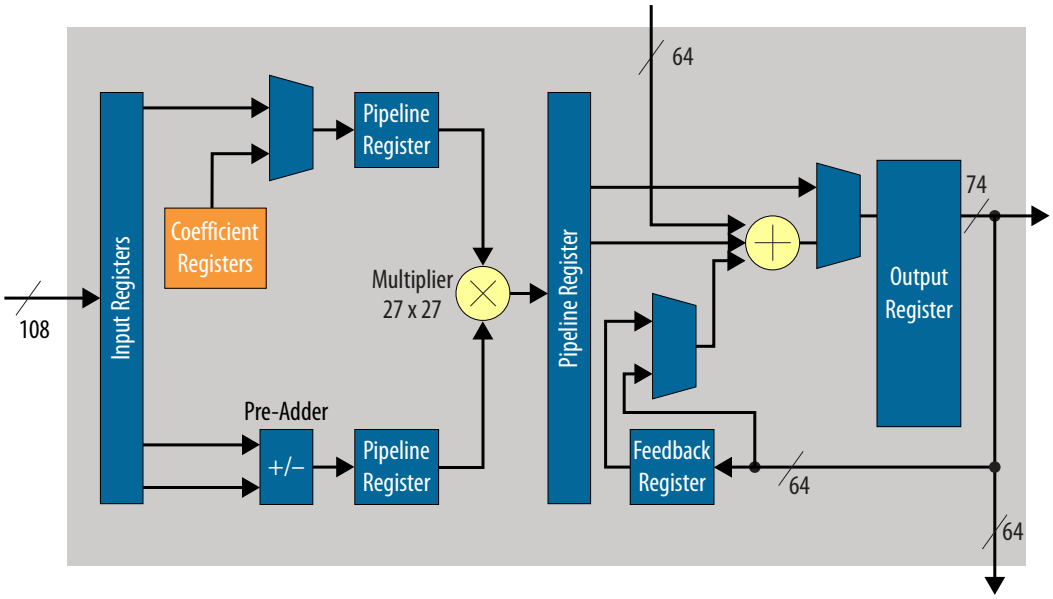

Figure 12. DSP Block: Single Precision Floating Point Mode

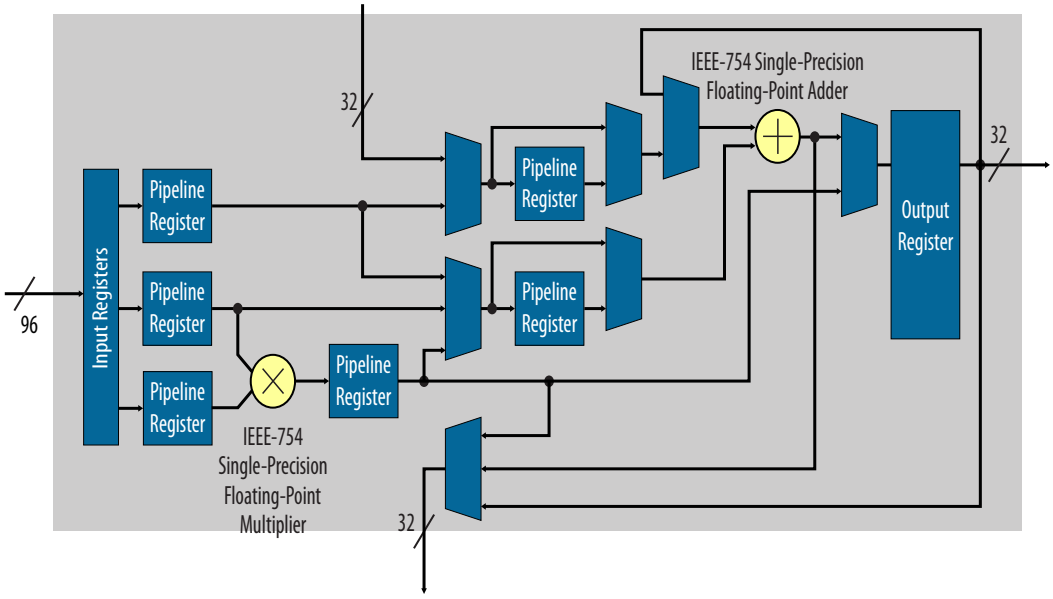


Each DSP block can be independently configured at compile time as either dual 18x19 or a single 27x27 multiply accumulate. With a dedicated 64-bit cascade bus, multiple variable precision DSP blocks can be cascaded to implement even higher precision DSP functions efficiently.

In floating point mode, each DSP block provides one single precision floating point multiplier and adder. Floating point additions, multiplications, mult-adds and mult-accumulates are supported.

The following table shows how different precisions are accommodated within a DSP block, or by utilizing multiple blocks.

Table 12. Variable Precision DSP Block Configurations

Multiplier Size	DSP Block Resources	Expected Usage
18x19 bits	1/2 of Variable Precision DSP Block	Medium precision fixed point
27x27 bits	1 Variable Precision DSP Block	High precision fixed point
19x36 bits	1 Variable Precision DSP Block with external adder	Fixed point FFTs
36x36 bits	2 Variable Precision DSP Blocks with external adder	Very high precision fixed point
54x54 bits	4 Variable Precision DSP Blocks with external adder	Double Precision floating point
Single Precision floating point	1 Single Precision floating point adder, 1 Single Precision floating point multiplier	Floating point

Complex multiplication is very common in DSP algorithms. One of the most popular applications of complex multipliers is the FFT algorithm. This algorithm has the characteristic of increasing precision requirements on only one side of the multiplier. The Variable Precision DSP block supports the FFT algorithm with proportional increase in DSP resources as the precision grows.

Table 13. Complex Multiplication With Variable Precision DSP Block

Complex Multiplier Size	DSP Block Resources	FFT Usage
18x19 bits	2 Variable Precision DSP Blocks	Resource optimized FFT
27x27 bits	4 Variable Precision DSP Blocks	Highest precision FFT

For FFT applications with high dynamic range requirements, the Intel FFT IP Core offers an option of single precision floating point implementation with resource usage and performance similar to high precision fixed point implementations.

Other features of the DSP block include:

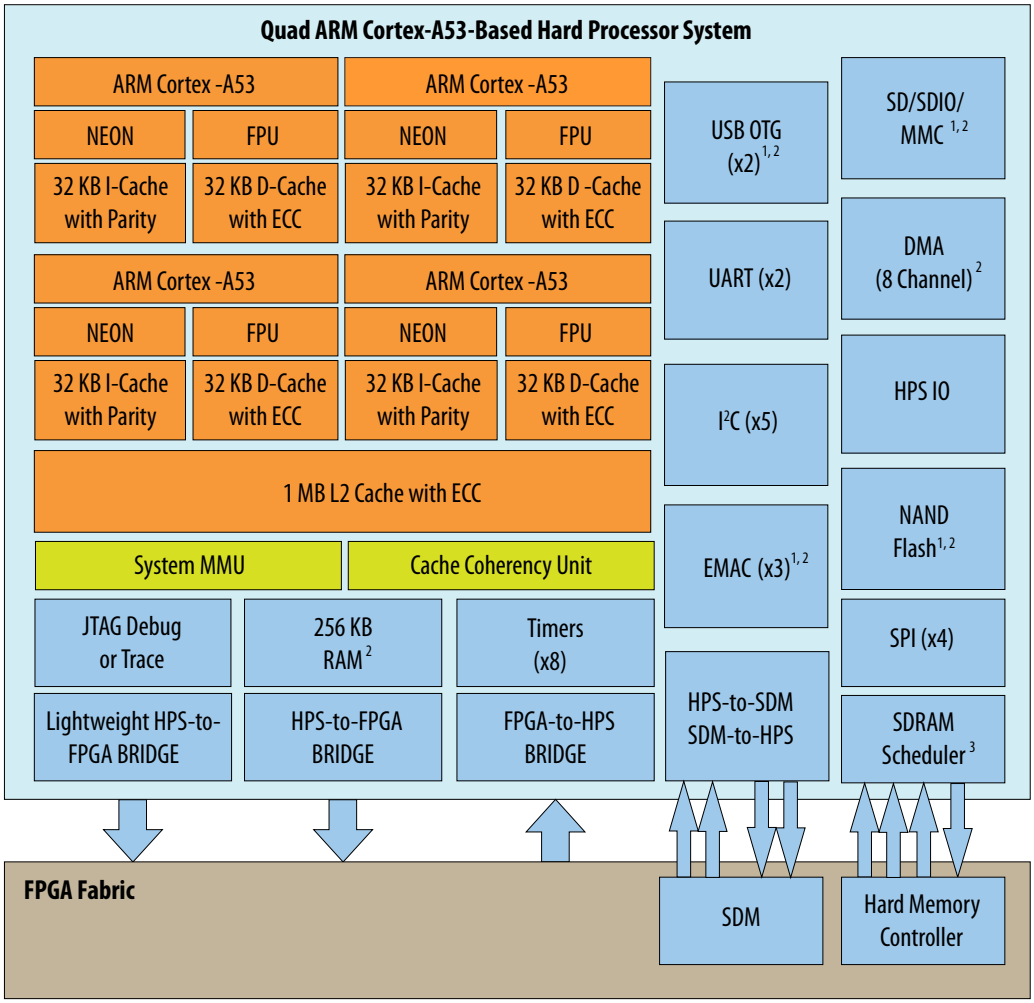
- Hard 18-bit and 25-bit pre-adders
- Hard floating point multipliers and adders
- 64-bit dual accumulator (for separate I, Q product accumulations)
- Cascaded output adder chains for 18- and 27-bit FIR filters
- Embedded coefficient registers for 18- and 27-bit coefficients
- Fully independent multiplier outputs
- Inferability using HDL templates supplied by the Intel Quartus Prime software for most modes

The Variable Precision DSP block is ideal to support the growing trend towards higher bit precision in high performance DSP applications. At the same time, it can efficiently support the many existing 18-bit DSP applications, such as high definition video processing and remote radio heads. With the Variable Precision DSP block architecture and hard floating point multipliers and adders, Intel Stratix 10 devices can efficiently support many different precision levels up to and including floating point implementations. This flexibility can result in increased system performance, reduced power consumption, and reduce architecture constraints on system algorithm designers.

1.18. Hard Processor System (HPS)

The Intel Stratix 10 SoC Hard Processor System (HPS) is Intel's industry leading third generation HPS. Leveraging the performance of Intel's 14-nm Tri-Gate technology, Intel Stratix 10 SoC devices more than double the performance of previous generation SoCs with an integrated quad-core 64-bit ARM Cortex-A53. The HPS also enables system-wide hardware virtualization capabilities by adding a system memory management unit. These architecture improvements ensure that Intel Stratix 10 SoCs will meet the requirements of current and future embedded markets, including wireless and wireline communications, data center acceleration, and numerous military applications.

Figure 13. HPS Block Diagram



Notes:
1. Integrated direct memory access (DMA)
2. Integrated error correction code (ECC)

1.18.1. Key Features of the Intel Stratix 10 HPS

Table 14. Key Features of the Intel Stratix 10 GX/SX HPS

Feature	Description
Quad-core ARM Cortex-A53 MPCore processor unit	• 2.3 MIPS/MHz instruction efficiency • CPU frequency up to 1.5 GHz • At 1.5 GHz total performance of 13,800 MIPS • ARMv8-A architecture • Runs 64-bit and 32-bit ARM instructions • 16-bit and 32-bit Thumb instructions for 30% reduction in memory footprint • Jazelle® RCT execution architecture with 8-bit Java bytecodes

continued...

1.19. Power Management

Intel Stratix 10 devices leverage the advanced Intel 14-nm Tri-Gate process technology, the all new HyperFlex core architecture to enable Hyper-Folding, power gating, and several optional power reduction techniques to reduce total power consumption by as much as 70% compared to previous generation high-performance Stratix V devices.

Intel Stratix 10 standard power devices (-V) are SmartVID devices. The core voltage supplies (VCC and VCCP) for each SmartVID device must be driven by a PMBus voltage regulator dedicated to that Intel Stratix 10 device. Use of a PMBus voltage regulator for each SmartVID (-V) device is mandatory; it is not an option. A code is programmed into each SmartVID device during manufacturing that allows the PMBus voltage regulator to operate at the optimum core voltage to meet the device performance specifications.

With the new HyperFlex core architecture, designs can run 2X faster than previous generation FPGAs. With 2X performance and same required throughput, architects can cut the data path width in half to save power. This optimization is called Hyper-Folding. Additionally, power gating reduces static power of unused resources in the FPGA by powering them down. The Intel Quartus Prime software automatically powers down specific unused resource blocks such as DSP and M20K blocks, at configuration time.

The optional power reduction techniques in Intel Stratix 10 devices include:

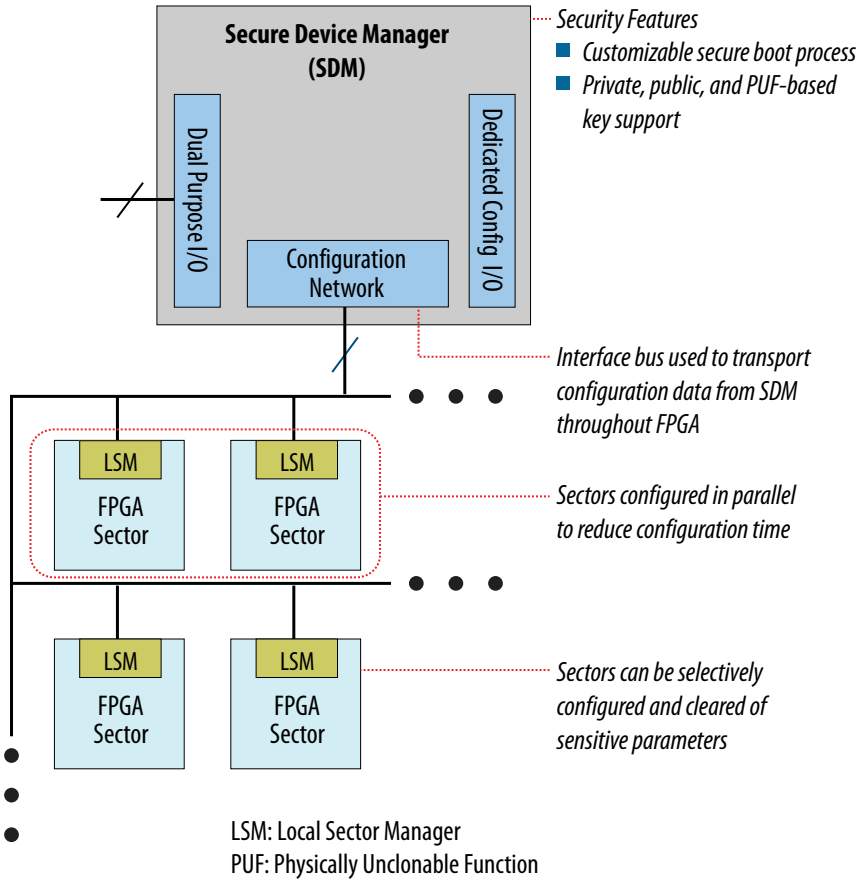
- **Available Low Static Power Devices**—Intel Stratix 10 devices are available with a fixed core voltage that provides lower static power than the SmartVID standard power devices, while maintaining device performance

Furthermore, Intel Stratix 10 devices feature Intel's industry-leading low power transceivers and include a number of hard IP blocks that not only reduce logic resources but also deliver substantial power savings compared to soft implementations. In general, hard IP blocks consume up to 50% less power than the equivalent soft logic implementations.

1.20. Device Configuration and Secure Device Manager (SDM)

All Intel Stratix 10 devices contain a Secure Device Manager (SDM), which is a dedicated triple-redundant processor that serves as the point of entry into the device for all JTAG and configuration commands. The SDM also bootstraps the HPS in SoC devices ensuring that the HPS can boot using the same security features that the FPGA devices have.

Figure 14. SDM Block Diagram



During configuration, Intel Stratix 10 devices are divided into logical sectors, each of which is managed by a local sector manager (LSM). The SDM passes configuration data to each of the LSMs across the on-chip configuration network. This allows the sectors to be configured independently, one at a time, or in parallel. This approach achieves simplified sector configuration and reconfiguration, as well as reduced overall configuration time due to the inherent parallelism. The same sector-based approach is used to respond to single-event upsets and security attacks.

While the sectors provide a logical separation for device configuration and reconfiguration, they overlay the normal rows and columns of FPGA logic and routing. This means there is no impact to the Intel Quartus Prime software place and route, and no impact to the timing of logic signals that cross the sector boundaries.

Document Version	Changes
	• Changed the features listed in the "Key Features of Stratix 10 Devices Compared to Stratix V Devices" table. • Changed the descriptions of the following areas of the "Stratix 10 FPGA and SoC Common Device Features" table: — Transceiver hard IP — Internal memory blocks — Core clock networks — Packaging • Reorganized and updated all tables in the "Stratix 10 FPGA and SoC Family Plan" section. • Removed the "Migration Between Arria 10 FPGAs and Stratix 10 FPGAs" section. • Removed footnotes from the "Transceiver PCS Features" table. • Changed the HMC description in the "External Memory and General Purpose I/O" section. • Changed the number of fPLLs in the "Fractional Synthesis PLLs and I/O PLLs" section. • Clarified HMC data width support in the "Key Features of the Stratix 10 HPS" table. • Changed the description in the "Internal Embedded Memory" section. • Changed the datarate for the Standard PCS and SDI PCS features in the "Transceiver PCS Features" table. • Added a note to the "PCI Express Gen1/Gen2/Gen3 Hard IP" section. • Updated the "Key Features of the Stratix 10 HPS" table. • Changed the description for the Cache coherency unit in the "Key Features of the Stratix 10 HPS" table. • Changed the description for the external SDRAM and Flash memory interfaces for HPS in the "Key Features of the Stratix 10 HPS" table.
2015.12.04	Initial release.
