What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	F²MC-16FX
Core Size	16-Bit
Speed	32MHz
Connectivity	CANbus, I²C, LINbus, SCI, UART/USART
Peripherals	DMA, LVD, POR, PWM, WDT
Number of I/O	81
Program Memory Size	288KB (288K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	24K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 24x8/10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LQFP
Supplier Device Package	100-LQFP (14x14)

- Hardware Watchdog Timer
  - Hardware watchdog timer is active after reset
  - Window function of Watchdog Timer is used to select the lower window limit of the watchdog interval
- Reload Timers
  - 16-bit wide
  - Prescaler with $1/2^1$, $1/2^2$, $1/2^3$, $1/2^4$, $1/2^5$, $1/2^6$ of peripheral clock frequency
  - Event count function
- Free-Running Timers
  - Signals an interrupt on overflow, supports timer clear upon match with Output Compare (0, 4)
  - Prescaler with 1, $1/2^1$, $1/2^2$, $1/2^3$, $1/2^4$, $1/2^5$, $1/2^6$, $1/2^7$, $1/2^8$ of peripheral clock frequency
- Input Capture Units
  - 16-bit wide
  - Signals an interrupt upon external event
  - Rising edge, Falling edge or Both (rising & falling) edges sensitive
- Output Compare Units
  - 16-bit wide
  - Signals an interrupt when a match with Free-running Timer occurs
  - A pair of compare registers can be used to generate an output signal
- Programmable Pulse Generator
  - 16-bit down counter, cycle and duty setting registers
  - Can be used as 2 × 8-bit PPG
  - Interrupt at trigger, counter borrow and/or duty match
  - PWM operation and one-shot operation
  - Internal prescaler allows 1, 1/4, 1/16, 1/64 of peripheral clock as counter clock or of selected Reload timer underflow as clock input
  - Can be triggered by software or reload timer
  - Can trigger ADC conversion
  - Timing point capture
  - Start delay
- Quadrature Position/Revolution Counter (QPRC)
  - Up/down count mode, Phase difference count mode, Count mode with direction
  - 16-bit position counter
  - 16-bit revolution counter
  - Two 16-bit compare registers with interrupt
  - Detection edge of the three external event input pins AIN, BIN and ZIN is configurable
- Real Time Clock
  - Operational on main oscillation (4MHz), sub oscillation (32kHz) or RC oscillation (100kHz/2MHz)
  - Capable to correct oscillation deviation of Sub clock or RC oscillator clock (clock calibration)
  - Read/write accessible second/minute/hour registers
  - Can signal interrupts every half second/second/minute/hour/day
  - Internal clock divider and prescaler provide exact 1s clock
- External Interrupts
  - Edge or Level sensitive
  - Interrupt mask bit per channel
  - Each available CAN channel RX has an external interrupt for wake-up
  - Selected USART channels SIN have an external interrupt for wake-up
- Non Maskable Interrupt
  - Disabled after reset, can be enabled by Boot-ROM depending on ROM configuration block
  - Once enabled, cannot be disabled other than by reset
  - High or Low level sensitive
  - Pin shared with external interrupt 0
- I/O Ports
  - Most of the external pins can be used as general purpose I/O
  - All push-pull outputs (except when used as I^2C SDA/SCL line)
  - Bit-wise programmable as input/output or peripheral signal
  - Bit-wise programmable input enable
  - One input level per GPIO-pin (either Automotive or CMOS hysteresis)
  - Bit-wise programmable pull-up resistor
- Built-in On Chip Debugger (OCD)
  - One-wire debug tool interface
  - Break function:
    - Hardware break: 6 points (shared with code event)
    - Software break: 4096 points
  - Event function
    - Code event: 6 points (shared with hardware break)
    - Data event: 6 points
    - Event sequencer: 2 levels + reset
  - Execution time measurement function
  - Trace function: 42 branches
  - Security function
- Flash Memory
  - Dual operation flash allowing reading of one Flash bank while programming or erasing the other bank
  - Command sequencer for automatic execution of programming algorithm and for supporting DMA for programming of the Flash Memory
  - Supports automatic programming, Embedded Algorithm
  - Write/Erase/Erase-Suspend/Resume commands
  - A flag indicating completion of the automatic algorithm
  - Erase can be performed on each sector individually
  - Sector protection
  - Flash Security feature to protect the content of the Flash
  - Low voltage detection during Flash erases or writes

■Precautions Related to Usage of Devices
Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

12.2 Precautions for Package Mounting
Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

■Lead Insertion Type
Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

■Surface Mount Type
Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

■Lead-Free Packaging
CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

■Storage of Semiconductor Devices
Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
   When you open Dry Package that recommends humidity 40% to 70% relative humidity.
3. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

■Baking
Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

13.8 Pin handling when not using the A/D converter

If the A/D converter is not used, the power supply pins for A/D converter should be connected such as $AV_{CC} = V_{CC}$, AV_{SS} = AVRH = V_{SS}.

13.9 Notes on Power-on

To prevent malfunction of the internal voltage regulator, supply voltage profile while turning the power supply on should be slower than 50µs from 0.2V to 2.7V.

13.10 Stabilization of power supply voltage

If the power supply voltage varies acutely even within the operation safety range of the V_{CC} power supply voltage, a malfunction may occur. The V_{CC} power supply voltage must therefore be stabilized. As stabilization guidelines, the power supply voltage must be stabilized in such a way that V_{CC} ripple fluctuations (peak to peak value) in the commercial frequencies (50Hz to 60Hz) fall within 10% of the standard V_{CC} power supply voltage and the transient fluctuation rate becomes 0.1V/µs or less in instantaneous fluctuation for power supply switching.

13.11 Serial communication

There is a possibility to receive wrong data due to noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider receiving of wrong data when designing the system. For example apply a checksum and retransmit the data if an error occurs.

13.12 Mode Pin (MD)

Connect the mode pin directly to Vcc or Vss pin. To prevent the device unintentionally entering test mode due to noise, lay out the printed circuit board so as to minimize the distance from the mode pin to Vcc or Vss pin and provide a low-impedance connection.

14.2 Recommended Operating Conditions

(V_{SS} = AV_{SS} = 0V)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	V_{CC}, AV_{CC}	2.7	-	5.5	V	
		2.0	-	5.5	V	Maintains RAM data in stop mode
Smoothing capacitor at C pin	C_S	0.5	1.0 to 3.9	4.7	µF	1.0µF (Allowance within ± 50%) 3.9µF (Allowance within ± 20%) Please use the ceramic capacitor or the capacitor of the frequency response of this level. The smoothing capacitor at V_{CC} must use the one of a capacity value that is larger than C_S.

WARNING

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.
Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

*1: If the power supply voltage fluctuates within the time less than the detection delay time (t_d), there is a possibility that the low voltage detection will occur or stop after the power supply voltage passes the detection range.

*2: In order to perform the low voltage detection at the detection voltage (V_{DLX}), be sure to suppress fluctuation of the power supply voltage within the limits of the change ration of power supply voltage.
