
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Discontinued at Digi-Key
Core Processor	CIP-51 8051
Core Size	8-Bit
Speed	50MHz
Connectivity	I²C, SMBus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	20
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	2.25K x 8
Voltage - Supply (Vcc/Vdd)	2.2V ~ 3.6V
Data Converters	A/D 12x10/12b SAR; D/A 2x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	24-VFQFN Exposed Pad
Supplier Device Package	24-QFN (3x3)
Purchase URL	https://www.e-xfl.com/product-detail/silicon-labs/efm8bb31f32g-a-qfn24r

3. System Overview

3.1 Introduction

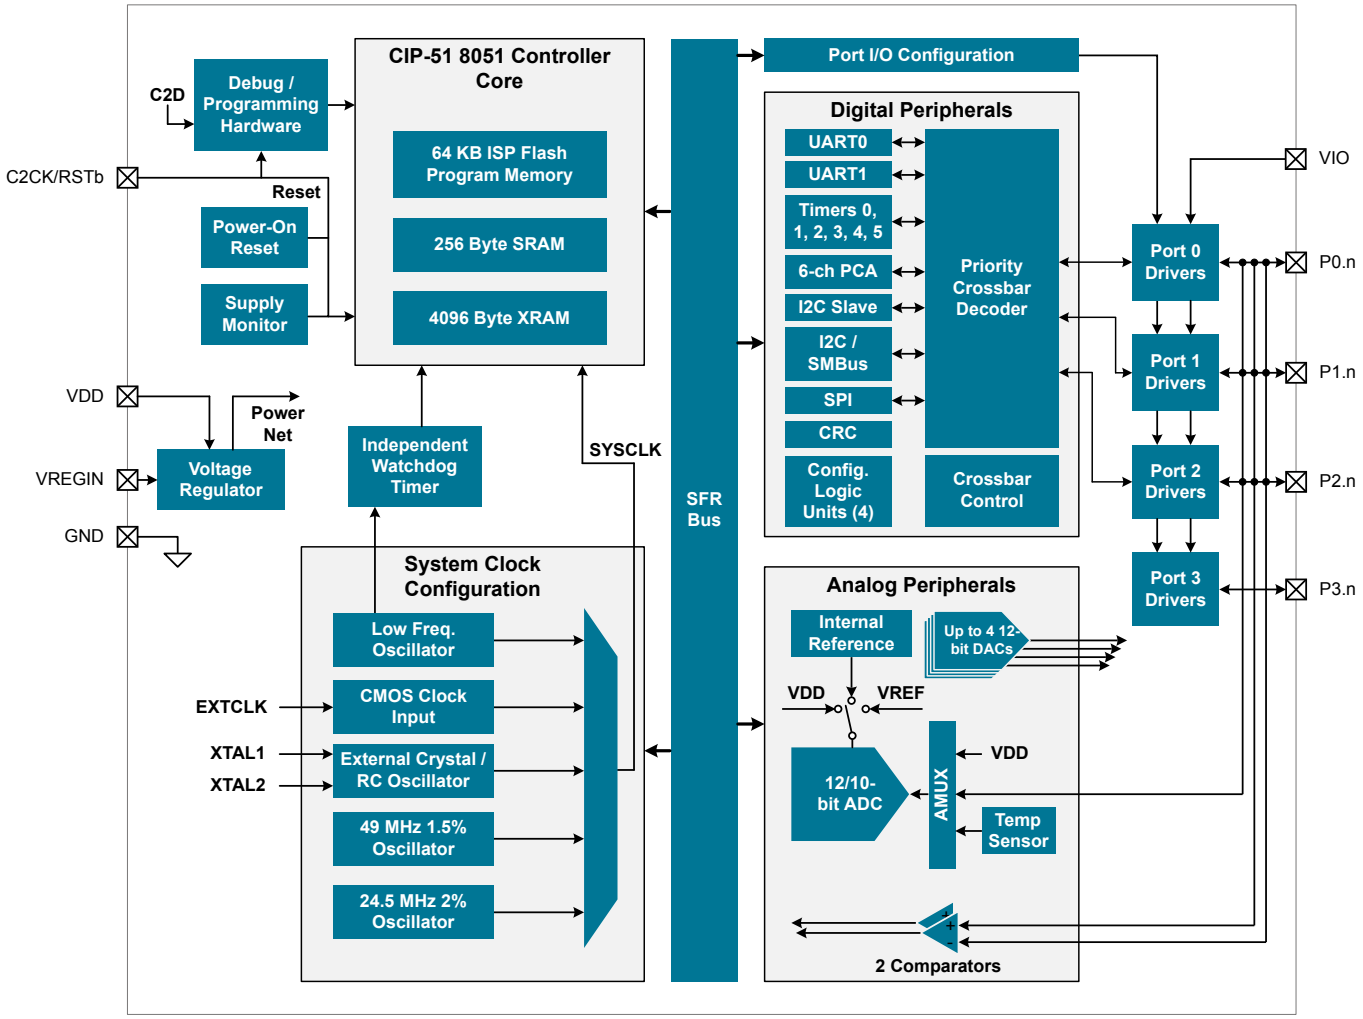

Figure 3.1. Detailed EFM8BB3 Block Diagram

3.2 Power

All internal circuitry draws power from the VDD supply pin. External I/O pins are powered from the VIO supply voltage (or VDD on devices without a separate VIO connection), while most of the internal circuitry is supplied by an on-chip LDO regulator. Control over the device power can be achieved by enabling/disabling individual peripherals as needed. Each analog peripheral can be disabled when not in use and placed in low power mode. Digital peripherals, such as timers and serial buses, have their clocks gated off and draw little power when they are not in use.

Table 3.1. Power Modes

Power Mode	Details	Mode Entry	Wake-Up Sources
Normal	Core and all peripherals clocked and fully operational		
Idle	• Core halted • All peripherals clocked and fully operational • Code resumes execution on wake event	Set IDLE bit in PCON0	Any interrupt
Suspend	• Core and peripheral clocks halted • HFOSC0 and HFOSC1 oscillators stopped • Regulator in normal bias mode for fast wake • Timer 3 and 4 may clock from LFOSC0 • Code resumes execution on wake event	1. Switch SYSCLK to HFOSC0 2. Set SUSPEND bit in PCON1	• Timer 4 Event • SPI0 Activity • I2C0 Slave Activity • Port Match Event • Comparator 0 Rising Edge • CLUn Interrupt-Enabled Event
Stop	• All internal power nets shut down • Pins retain state • Exit on any reset source	1. Clear STOPCF bit in REG0CN 2. Set STOP bit in PCON0	Any reset source
Snooze	• Core and peripheral clocks halted • HFOSC0 and HFOSC1 oscillators stopped • Regulator in low bias current mode for energy savings • Timer 3 and 4 may clock from LFOSC0 • Code resumes execution on wake event	1. Switch SYSCLK to HFOSC0 2. Set SNOOZE bit in PCON1	• Timer 4 Event • SPI0 Activity • I2C0 Slave Activity • Port Match Event • Comparator 0 Rising Edge • CLUn Interrupt-Enabled Event
Shutdown	• All internal power nets shut down • Pins retain state • Exit on pin or power-on reset	1. Set STOPCF bit in REG0CN 2. Set STOP bit in PCON0	• RSTb pin reset • Power-on reset

3.3 I/O

Digital and analog resources are externally available on the device's multi-purpose I/O pins. Port pins P0.0-P2.3 can be defined as general-purpose I/O (GPIO), assigned to one of the internal digital resources through the crossbar or dedicated channels, or assigned to an analog function. Port pins P2.4 to P3.7 can be used as GPIO. Additionally, the C2 Interface Data signal (C2D) is shared with P3.0 or P3.7, depending on the package option.

The port control block offers the following features:

- Up to 29 multi-functions I/O pins, supporting digital and analog functions.
- Flexible priority crossbar decoder for digital peripheral assignment.
- Two drive strength settings for each port.
- State retention feature allows pins to retain configuration through most reset sources.
- Two direct-pin interrupt sources with dedicated interrupt vectors (INT0 and INT1).
- Up to 24 direct-pin interrupt sources with shared interrupt vector (Port Match).

3.4 Clocking

The CPU core and peripheral subsystem may be clocked by both internal and external oscillator resources. By default, the system clock comes up running from the 24.5 MHz oscillator divided by 8.

The clock control system offers the following features:

- Provides clock to core and peripherals.
- 24.5 MHz internal oscillator (HFOSC0), accurate to ±2% over supply and temperature corners.
- 49 MHz internal oscillator (HFOSC1), accurate to ±2% over supply and temperature corners.
- 80 kHz low-frequency oscillator (LFOSC0).
- External Crystal / RC / C Oscillator.
- External CMOS clock input (EXTCLK).
- Clock divider with eight settings for flexible clock scaling:
  - Divide the selected clock source by 1, 2, 4, 8, 16, 32, 64, or 128.
  - HFOSC0 and HFOSC1 include 1.5x pre-scalers for further flexibility.

3.5 Counters/Timers and PWM

Programmable Counter Array (PCA0)

The programmable counter array (PCA) provides multiple channels of enhanced timer and PWM functionality while requiring less CPU intervention than standard counter/timers. The PCA consists of a dedicated 16-bit counter/timer and one 16-bit capture/compare module for each channel. The counter/timer is driven by a programmable timebase that has flexible external and internal clocking options. Each capture/compare module may be configured to operate independently in one of five modes: Edge-Triggered Capture, Software Timer, High-Speed Output, Frequency Output, or Pulse-Width Modulated (PWM) Output. Each capture/compare module has its own associated I/O line (CEXn) which is routed through the crossbar to port I/O when enabled.

- 16-bit time base
- Programmable clock divisor and clock source selection
- Up to six independently-configurable channels
- 8, 9, 10, 11 and 16-bit PWM modes (center or edge-aligned operation)
- Output polarity control
- Frequency output mode
- Capture on rising, falling or any edge
- Compare function for arbitrary waveform generation
- Software timer (internal compare) mode
- Can accept hardware “kill” signal from comparator 0 or comparator 1

Universal Asynchronous Receiver/Transmitter (UART1)

UART1 is an asynchronous, full duplex serial port offering a variety of data formatting options. A dedicated baud rate generator with a 16-bit timer and selectable prescaler is included, which can generate a wide range of baud rates. A received data FIFO allows UART1 to receive multiple bytes before data is lost and an overflow occurs.

UART1 provides the following features:

- Asynchronous transmissions and receptions
- Dedicated baud rate generator supports baud rates up to SYSCLK/2 (transmit) or SYSCLK/8 (receive)
- 5, 6, 7, 8, or 9 bit data
- Automatic start and stop generation
- Automatic parity generation and checking
- Single-byte buffer on transmit and receive
- Auto-baud detection
- LIN break and sync field detection
- CTS / RTS hardware flow control

Serial Peripheral Interface (SPI0)

The serial peripheral interface (SPI) module provides access to a flexible, full-duplex synchronous serial bus. The SPI can operate as a master or slave device in both 3-wire or 4-wire modes, and supports multiple masters and slaves on a single SPI bus. The slave-select (NSS) signal can be configured as an input to select the SPI in slave mode, or to disable master mode operation in a multi-master environment, avoiding contention on the SPI bus when more than one master attempts simultaneous data transfers. NSS can also be configured as a firmware-controlled chip-select output in master mode, or disabled to reduce the number of pins required. Additional general purpose port I/O pins can be used to select multiple slave devices in master mode.

- Supports 3- or 4-wire master or slave modes
- Supports external clock frequencies up to 12 Mbps in master or slave mode
- Support for all clock phase and polarity modes
- 8-bit programmable clock rate (master)
- Programmable receive timeout (slave)
- Two byte FIFO on transmit and receive
- Can operate in suspend or snooze modes and wake the CPU on reception of a byte
- Support for multiple masters on the same data lines

System Management Bus / I2C (SMB0)

The SMBus I/O interface is a two-wire, bi-directional serial bus. The SMBus is compliant with the System Management Bus Specification, version 1.1, and compatible with the I^2C serial bus.

The SMBus module includes the following features:

- Standard (up to 100 kbps) and Fast (400 kbps) transfer speeds
- Support for master, slave, and multi-master modes
- Hardware synchronization and arbitration for multi-master mode
- Clock low extending (clock stretching) to interface with faster masters
- Hardware support for 7-bit slave and general call address recognition
- Firmware support for 10-bit slave address decoding
- Ability to inhibit all slave states
- Programmable data setup/hold times
- Transmit and receive buffers to help increase throughput in faster applications

3.10 Bootloader

All devices come pre-programmed with a UART0 bootloader. This bootloader resides in the code security page, which is the last page of code flash; it can be erased if it is not needed.

The byte before the Lock Byte is the Bootloader Signature Byte. Setting this byte to a value of 0xA5 indicates the presence of the bootloader in the system. Any other value in this location indicates that the bootloader is not present in flash.

When a bootloader is present, the device will jump to the bootloader vector after any reset, allowing the bootloader to run. The bootloader then determines if the device should stay in bootload mode or jump to the reset vector located at 0x0000. When the bootloader is not present, the device will jump to the reset vector of 0x0000 after any reset.

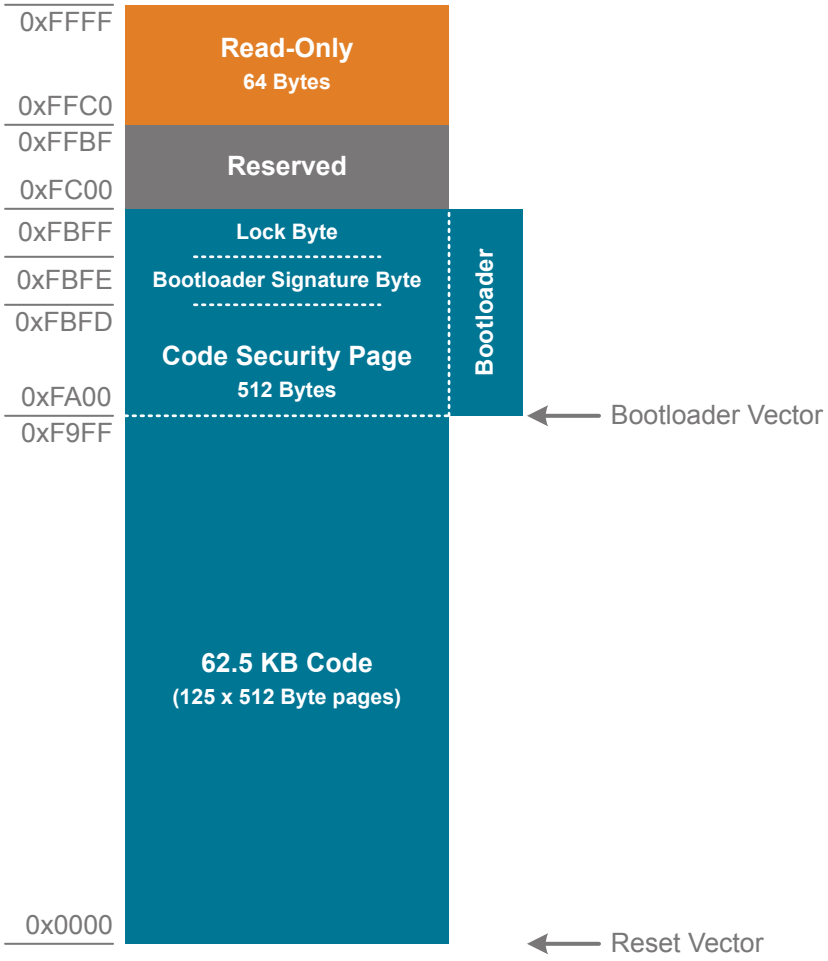

Figure 3.2. Flash Memory Map with Bootloader — 62.5 KB Devices

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Offset Temperature Coefficient	TC_{OFF}		—	TBD	—	LSB/°C
Slope Error	E_M	12 Bit Mode	—	TBD	TBD	%
		10 Bit Mode	—	TBD	—	%
Dynamic Performance 10 kHz Sine Wave Input 1 dB below full scale, Max throughput, using AGND pin						
Signal-to-Noise	SNR	12 Bit Mode	—	TBD	—	dB
		10 Bit Mode	—	TBD	—	dB
Signal-to-Noise Plus Distortion	SNDR	12 Bit Mode	TBD	TBD	—	dB
		10 Bit Mode	—	TBD	—	dB
Total Harmonic Distortion (Up to 5th Harmonic)	THD	12 Bit Mode	—	TBD	—	dB
		10 Bit Mode	—	TBD	—	dB
Spurious-Free Dynamic Range	SFDR	12 Bit Mode	—	TBD	—	dB
		10 Bit Mode	—	TBD	—	dB

Note:

1. Conversion Time does not include Tracking Time. Total Conversion Time is:

   Total Conversion Time = [RPT × (ADTK + NUMBITS + 1) × T(SARCLK)] + (T(ADCCLK) × 4)

   where RPT is the number of conversions represented by the ADRPT field and ADCCLK is the clock selected for the ADC.
2. Absolute input pin voltage is limited by the V_{IO} supply.

4.1.11 Temperature Sensor

Table 4.11. Temperature Sensor

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Offset	V_{OFF}	T_A = 0 °C	—	TBD	—	mV
Offset Error[1]	E_{OFF}	T_A = 0 °C	—	TBD	—	mV
Slope	M		—	TBD	—	mV/°C
Slope Error[1]	E_M		—	TBD	—	µV/°C
Linearity			—	TBD	—	°C
Turn-on Time			—	TBD	—	µs

Note:
1. Represents one standard deviation from the mean.

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Negative Hysteresis Mode 3 (CPMD = 11)	HYS_{CP-}	CPHYN = 00	—	-1.5	—	mV
		CPHYN = 01	—	-4	—	mV
		CPHYN = 10	—	-8	—	mV
		CPHYN = 11	—	-16	—	mV
Input Range (CP+ or CP-)	V_{IN}		-0.25	—	V_{IO}+0.25	V
Input Pin Capacitance	C_{CP}		—	7.5	—	pF
Internal Reference DAC Resolution	N_{bits}			6		bits
Common-Mode Rejection Ratio	$CMRR_{CP}$		—	70	—	dB
Power Supply Rejection Ratio	$PSRR_{CP}$		—	72	—	dB
Input Offset Voltage	V_{OFF}	T_A = 25 °C	-10	0	10	mV
Input Offset Tempco	TC_{OFF}		—	3.5	—	µV/°

4.1.14 Configurable Logic

10.3 QSOP24 Package Marking

Figure 10.3. QSOP24 Package Marking

The package marking consists of:

- PPPPPPPP – The part number designation.
- TTTTTT – A trace or manufacturing code.
- YY – The last 2 digits of the assembly year.
- WW – The 2-digit workweek when the device was assembled.
- # – The device revision (A, B, etc.).

11. Revision History

11.1 Revision 0.1

Initial release.

11.2 Revision 0.2

Added information on the bootloader to 3.10 Bootloader.

Updated some characterization TBD values.
