### **Understanding Embedded - CPLDs (Complex Programmable Logic Devices)**

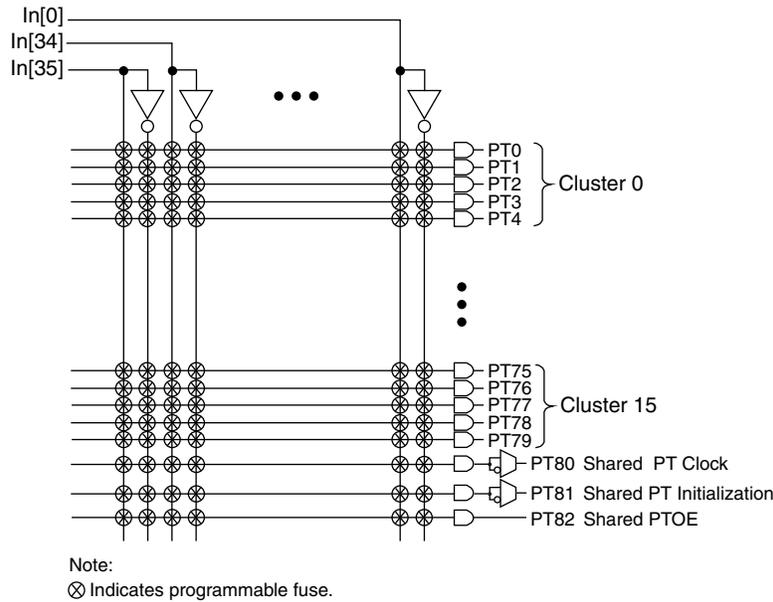

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

#### **Details**

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	5 ns
Voltage Supply - Internal	1.65V ~ 1.95V
Number of Logic Elements/Blocks	8
Number of Macrocells	128
Number of Gates	-
Number of I/O	92
Operating Temperature	-40°C ~ 105°C (Tj)
Mounting Type	Surface Mount
Package / Case	128-LQFP
Supplier Device Package	128-TQFP (14x14)

### Enhanced Logic Allocator

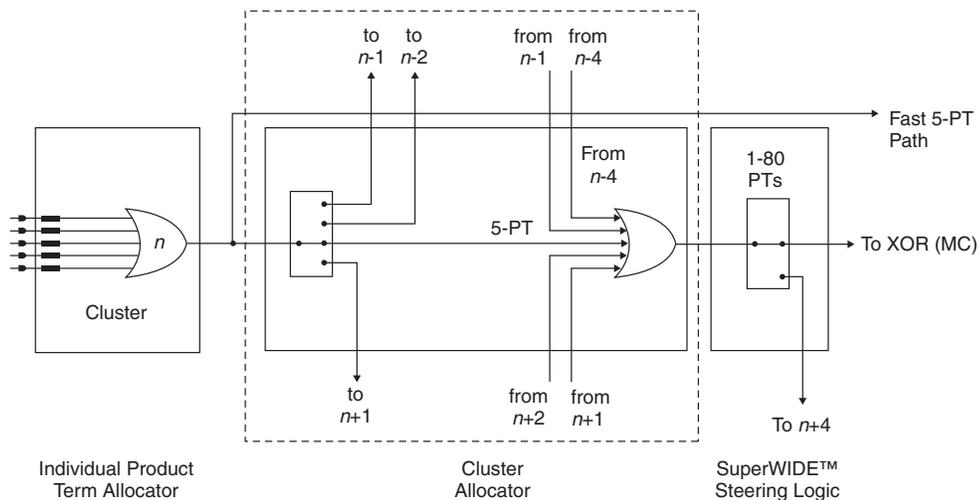

Within the logic allocator, product terms are allocated to macrocells in product term clusters. Each product term cluster is associated with a macrocell. The cluster size for the ispMACH 4000 family is 4+1 (total 5) product terms. The software automatically considers the availability and distribution of product term clusters as it fits the functions within a GLB. The logic allocator is designed to provide three speed paths: 5-PT fast bypass path, 20-PT Speed Locking path and an up to 80-PT path. The availability of these three paths lets designers trade timing variability for increased performance.

The enhanced Logic Allocator of the ispMACH 4000 family consists of the following blocks:

- Product Term Allocator
- Cluster Allocator
- Wide Steering Logic

Figure 4 shows a macrocell slice of the Logic Allocator. There are 16 such slices in the GLB.

Figure 4. Macrocell Slice

### Output Routing Pool (ORP)

The Output Routing Pool allows macrocell outputs to be connected to any of several I/O cells within an I/O block. This provides greater flexibility in determining the pinout and allows design changes to occur without affecting the pinout. The output routing pool also provides a parallel capability for routing macrocell-level OE product terms. This allows the OE product term to follow the macrocell output as it is switched between I/O cells. Additionally, the output routing pool allows the macrocell output or true and complement forms of the 5-PT bypass signal to bypass the output routing multiplexers and feed the I/O cell directly. The enhanced ORP of the ispMACH 4000 family consists of the following elements:

- Output Routing Multiplexers
- OE Routing Multiplexers
- Output Routing Pool Bypass Multiplexers

Figure 7 shows the structure of the ORP from the I/O cell perspective. This is referred to as an ORP slice. Each ORP has as many ORP slices as there are I/O cells in the corresponding I/O block.

**Figure 7. ORP Slice**

### Output Routing Multiplexers

The details of connections between the macrocells and the I/O cells vary across devices and within a device dependent on the maximum number of I/Os available. Tables 5-9 provide the connection details.

**Table 6. ORP Combinations for I/O Blocks with 8 I/Os**

## IEEE 1532-Compliant In-System Programming

Programming devices in-system provides a number of significant benefits including: rapid prototyping, lower inventory levels, higher quality and the ability to make in-field modifications. All ispMACH 4000 devices provide In-System Programming (ISP™) capability through the Boundary Scan Test Access Port. This capability has been implemented in a manner that ensures that the port remains compliant to the IEEE 1149.1 standard. By using IEEE 1149.1 as the communication interface through which ISP is achieved, users get the benefit of a standard, well-defined interface. All ispMACH 4000 devices are also compliant with the IEEE 1532 standard.

The ispMACH 4000 devices can be programmed across the commercial temperature and voltage range. The PC-based Lattice software facilitates in-system programming of ispMACH 4000 devices. The software takes the JEDEC file output produced by the design implementation software, along with information about the scan chain, and creates a set of vectors used to drive the scan chain. The software can use these vectors to drive a scan chain via the parallel port of a PC. Alternatively, the software can output files in formats understood by common automated test equipment. This equipment can then be used to program ispMACH 4000 devices during the testing of a circuit board.

## User Electronic Signature

The User Electronic Signature (UES) allows the designer to include identification bits or serial numbers inside the device, stored in E<sup>2</sup>CMOS memory. The ispMACH 4000 device contains 32 UES bits that can be configured by the user to store unique data such as ID codes, revision numbers or inventory control codes.

## Security Bit

A programmable security bit is provided on the ispMACH 4000 devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

## Hot Socketing

The ispMACH 4000 devices are well-suited for applications that require hot socketing capability. Hot socketing a device requires that the device, during power-up and down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of I/O pin loading be minimal on active signals. The ispMACH 4000 devices provide this capability for input voltages in the range 0V to 3.0V.

## Density Migration

The ispMACH 4000 family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is possible to shift a lower utilization design targeted for a high density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

## Revision History

Date	Version	Change Summary
—	—	Previous Lattice releases.
July 2003	17z	Changed device status for LC4064ZC and LC4128ZC to production release and updated/added AC and DC parameters as well as ordering part numbers for LC4064ZC and LC4128ZC devices.
		Improved leakage current specifications for ispMACH 4000Z. For ispMACH 4000V/B/C IIL, IIH condition now includes 0V and 3.6V end points ( $0 \leq V_{IN} \leq 3.6V$ ).
		Added 132-ball chip scale BGA power supply and NC connections.
		Added 132-ball chip scale BGA logic signal connections for LC4064ZC, LC4128ZC and LC4256ZC devices.
		Added lead-free package designators.
October 2003	18z	Hot socketing characteristics footnote 1. has been enhanced; Insensitive to sequence of VCC or VCCO. However, assumes monotonic rise/fall rates for Vcc and Vcco, provided ( $V_{IN} - V_{CCO}$ ) $\leq$ 3.6V.
		Improved LC4064ZC t <sub>S</sub> to 2.5ns, t <sub>ST</sub> to 2.7ns and f <sub>MAX</sub> (Ext.) to 175MHz, LC4128ZC t <sub>CO</sub> to 3.5ns and f <sub>MAX</sub> (Ext.) to 161MHz (version v.2.1).
		Improved associated internal timing numbers and timing adders (version v.2.1).
		Added ispMACH 4000V/B/C/Z ORP Reference Tables.
		Enhanced ORP information in device pinout tables consistent with the ORP Combinations for I/O Blocks tables (table 6, 7, 8 and 9 in page 9-11).
		Corrected GLB/MC/Pad information in the 256-fpBGA pinouts for the LC4256V/B/C 160-I/O version.
		Added the ispMACH 4000 Family Speed Grade Offering table.
		Added the ispMACH 4128ZC Industrial and Automotive Device OPNs
December 2003	19z	Added the ispMACH 4032ZC and 4064ZC Industrial and Automotive Device OPNs

**Revision History (Cont.)**

Date	Version	Change Summary
January 2004	20z	ispMACH 4000Z data sheet status changed from preliminary to final. Documents production release of the ispMACH 4256Z device.
		Added new feature - ispMACH 4000Z supports operation down to 1.6V.
		Added lead-free packaging ordering part numbers for the ispMACH 4000Z/C/V devices.
April 2004	21z	Updated I <sub>P<sub>U</sub></sub> (I/O Weak Pull-up Resistor Current) max. specification for the ispMACH 4000V/B/C; -150µA to -200µA.
November 2004	22z	Added User Electronic Signature section.
		Added ispMACH 4000B (2.5V) Lead-Free Ordering Part Numbers.
December 2004	22z.1	Updated Further Information section.
February 2006	22z.2	Clarification to ispMACH 4000Z Input Leakage (I <sub>IH</sub> ) specification.
March 2007	22.3	Updated ispMACH 4000 Introduction section.
		Updated Signal Descriptions table.
June 2007	22.4	Updated Features bullets to include reference to “LA” automotive data sheet under the “Broad Device Offering” bullet.
		Added footnote 1 to Part Number Description to reference the “LA” automotive data sheet.
		Changed device temperature references from ‘Automotive’ to “Extended Temperature” for non-AEC-Q100 qualified devices.
November 2007	23.0	Added 256-ftBGA package Ordering Part Number information per PCN#14A-07.
May 2009	23.1	Correction to t <sub>CW</sub> , t <sub>GW</sub> , t <sub>WIR</sub> and f <sub>MAX</sub> parameters in ispMACH 4000Z External Switching Characteristics table.
		Correction to t <sub>CW</sub> , t <sub>GW</sub> , t <sub>WIR</sub> and f <sub>MAX</sub> parameters in ispMACH 4000V/B/C External Switching Characteristics table.
