## Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

## Applications of Embedded - CPLDs

### Details

|                                 |                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Status                  | Obsolete                                                                                                                                                              |
| Programmable Type               | In System Programmable                                                                                                                                                |
| Delay Time tpd(1) Max           | 7.5 ns                                                                                                                                                                |
| Voltage Supply - Internal       | 1.7V ~ 1.9V                                                                                                                                                           |
| Number of Logic Elements/Blocks | 8                                                                                                                                                                     |
| Number of Macrocells            | 128                                                                                                                                                                   |
| Number of Gates                 | -                                                                                                                                                                     |
| Number of I/O                   | 64                                                                                                                                                                    |
| Operating Temperature           | 0°C ~ 90°C (TJ)                                                                                                                                                       |

- Block CLK2
- Block CLK3
- PT Clock
- PT Clock Inverted
- Shared PT Clock
- Ground

### Clock Enable Multiplexer

Each macrocell has a 4:1 clock enable multiplexer. This allows the clock enable signal to be selected from the following four sources:

- PT Initialization/CE
- PT Initialization/CE Inverted
- Shared PT Clock
- Logic High

### Initialization Control

The ispMACH 4000 family architecture accommodates both block-level and macrocell-level set and reset capability. There is one block-level initialization term that is distributed to all macrocell registers in a GLB. At the macrocell level, two product terms can be “stolen” from the cluster associated with a macrocell to be used for set/reset functionality. A reset/preset swapping feature in each macrocell allows for reset and preset to be exchanged, providing flexibility.

Note that the reset/preset swapping selection feature affects power-up reset as well. All flip-flops power up to a known state for predictable system initialization. If a macrocell is configured to SET on a signal from the block-level initialization, then that macrocell will be SET during device power-up. If a macrocell is configured to RESET on a signal from the block-level initialization or is not configured for set/reset, then that macrocell will RESET on power-up. To guarantee initialization values, the  $V_{CC}$  rise must be monotonic, and the clock must be inactive until the reset delay time has elapsed.

### GLB Clock Generator

Each ispMACH 4000 device has up to four clock pins that are also routed to the GRP to be used as inputs. These pins drive a clock generator in each GLB, as shown in Figure 6. The clock generator provides four clock signals that can be used anywhere in the GLB. These four GLB clock signals can consist of a number of combinations of the true and complement edges of the global clock signals.

**Figure 6. GLB Clock Generator**

**Table 7. ORP Combinations for I/O Blocks with 16 I/Os**

| I/O Cell | Available Macrocells                 |
|----------|--------------------------------------|
| I/O 0    | M0, M1, M2, M3, M4, M5, M6, M7       |
| I/O 1    | M1, M2, M3, M4, M5, M6, M7, M8       |
| I/O 2    | M2, M3, M4, M5, M6, M7, M8, M9       |
| I/O 3    | M3, M4, M5, M6, M7, M8, M9, M10      |
| I/O 4    | M4, M5, M6, M7, M8, M9, M10, M11     |
| I/O 5    | M5, M6, M7, M8, M9, M10, M11, M12    |
| I/O 6    | M6, M7, M8, M9, M10, M11, M12, M13   |
| I/O 7    | M7, M8, M9, M10, M11, M12, M13, M14  |
| I/O 8    | M8, M9, M10, M11, M12, M13, M14, M15 |
| I/O 9    | M9, M10, M11, M12, M13, M14, M15, M0 |
| I/O 10   | M10, M11, M12, M13, M14, M15, M0, M1 |
| I/O 11   | M11, M12, M13, M14, M15, M0, M1, M2  |
| I/O 12   | M12, M13, M14, M15, M0, M1, M2, M3   |
| I/O 13   | M13, M14, M15, M0, M1, M2, M3, M4    |
| I/O 14   | M14, M15, M0, M1, M2, M3, M4, M5     |
| I/O 15   | M15, M0, M1, M2, M3, M4, M5, M6      |

**Table 8. ORP Combinations for I/O Blocks with 4 I/Os**

| I/O Cell | Available Macrocells                 |
|----------|--------------------------------------|
| I/O 0    | M0, M1, M2, M3, M4, M5, M6, M7       |
| I/O 1    | M4, M5, M6, M7, M8, M9, M10, M11     |
| I/O 2    | M8, M9, M10, M11, M12, M13, M14, M15 |

## ORP Bypass and Fast Output Multiplexers

The ORP bypass and fast-path output multiplexer is a 4:1 multiplexer and allows the 5-PT fast path to bypass the ORP and be connected directly to the pin with either the regular output or the inverted output. This multiplexer also allows the register output to bypass the ORP to achieve faster  $t_{CO}$ .

## Output Enable Routing Multiplexers

The OE Routing Pool provides the corresponding local output enable (OE) product term to the I/O cell.

## I/O Cell

The I/O cell contains the following programmable elements: output buffer, input buffer, OE multiplexer and bus maintenance circuitry. Figure 8 details the I/O cell.

**Figure 8. I/O Cell**

Each output supports a variety of output standards dependent on the  $V_{CCO}$  supplied to its I/O bank. Outputs can also be configured for open drain operation. Each input can be programmed to support a variety of standards, independent of the  $V_{CCO}$  supplied to its I/O bank. The I/O standards supported are:

**Figure 10. Global OE Generation for ispMACH 4032**

## Zero Power/Low Power and Power Management

The ispMACH 4000 family is designed with high speed low power design techniques to offer both high speed and low power. With an advanced  $E^2$  low power cell and non sense-amplifier design approach (full CMOS logic approach), the ispMACH 4000 family offers SuperFAST pin-to-pin speeds, while simultaneously delivering low standby power without needing any “turbo bits” or other power management schemes associated with a traditional sense-amplifier approach.

The zero power ispMACH 4000Z is based on the 1.8V ispMACH 4000C family. With innovative circuit design changes, the ispMACH 4000Z family is able to achieve the industry’s “lowest static power”.

## IEEE 1149.1-Compliant Boundary Scan Testability

All ispMACH 4000 devices have boundary scan cells and are compliant to the IEEE 1149.1 standard. This allows functional testing of the circuit board on which the device is mounted through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test node data to be captured and shifted out for verification. In addition, these devices can be linked into a board-level serial scan path for more board-level testing. The test access port operates with an LVCMOS interface that corresponds to the power supply voltage.

## I/O Quick Configuration

To facilitate the most efficient board test, the physical nature of the I/O cells must be set before running any continuity tests. As these tests are fast, by nature, the overhead and time that is required for configuration of the I/Os’ physical nature should be minimal so that board test time is minimized. The ispMACH 4000 family of devices allows this by offering the user the ability to quickly configure the physical nature of the I/O cells. This quick configuration takes milliseconds to complete, whereas it takes seconds for the entire device to be programmed. Lattice’s ispVM<sup>®</sup> System programming software can either perform the quick configuration through the PC parallel port, or can generate the ATE or test vectors necessary for a third-party test system.

## IEEE 1532-Compliant In-System Programming

Programming devices in-system provides a number of significant benefits including: rapid prototyping, lower inventory levels, higher quality and the ability to make in-field modifications. All ispMACH 4000 devices provide In-System Programming (ISP™) capability through the Boundary Scan Test Access Port. This capability has been implemented in a manner that ensures that the port remains compliant to the IEEE 1149.1 standard. By using IEEE 1149.1 as the communication interface through which ISP is achieved, users get the benefit of a standard, well-defined interface. All ispMACH 4000 devices are also compliant with the IEEE 1532 standard.

The ispMACH 4000 devices can be programmed across the commercial temperature and voltage range. The PC-based Lattice software facilitates in-system programming of ispMACH 4000 devices. The software takes the JEDEC file output produced by the design implementation software, along with information about the scan chain, and creates a set of vectors used to drive the scan chain. The software can use these vectors to drive a scan chain via the parallel port of a PC. Alternatively, the software can output files in formats understood by common automated test equipment. This equipment can then be used to program ispMACH 4000 devices during the testing of a circuit board.

## User Electronic Signature

The User Electronic Signature (UES) allows the designer to include identification bits or serial numbers inside the device, stored in E<sup>2</sup>CMOS memory. The ispMACH 4000 device contains 32 UES bits that can be configured by the user to store unique data such as ID codes, revision numbers or inventory control codes.

## Security Bit

A programmable security bit is provided on the ispMACH 4000 devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

## Hot Socketing

The ispMACH 4000 devices are well-suited for applications that require hot socketing capability. Hot socketing a device requires that the device, during power-up and down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of I/O pin loading be minimal on active signals. The ispMACH 4000 devices provide this capability for input voltages in the range 0V to 3.0V.

## Density Migration

The ispMACH 4000 family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is possible to shift a lower utilization design targeted for a high density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

| $t_{GPTOE/DIS}$  | Input to output global product term output enable/disable                  | —    | 9.0  | —    | 10.3 | —    | 12.0 | ns    |
| $t_{GOE/DIS}$    | Global OE input to output enable/disable                                   | —    | 5.0  | —    | 7.0  | —    | 8.0  | ns    |
| $t_{CW}$         | Global clock width, high or low                                            | 2.2  | —    | 2.8  | —    | 4.0  | —    | ns    |
| $t_{GW}$         | Global gate width low (for low transparent) or high (for high transparent) | 2.2  | —    | 2.8  | —    | 4.0  | —    | ns    |
| $t_{WIR}$        | Input register clock width, high or low                                    | 2.2  | —    | 2.8  | —    | 4.0  | —    | ns    |
| $f_{MAX}^4$      | Clock frequency with internal feedback                                     | —    | 227  | —    | 168  | —    | 125  | MHz   |
| $f_{MAX} (Ext.)$ | Clock frequency with external feedback, $[1/(t_S + t_{CO})]$               | —    | 156  | —    | 111  | —    | 86   | MHz   |

1. Timing numbers are based on default LVCMOS 1.8 I/O buffers. Use timing adjusters provided to calculate other standards.

Timing v.3.2

2. Measured using standard switching circuit, assuming GRP loading of 1 and 1 output switching.

3. Pulse widths and clock widths less than minimum will cause unknown behavior.

4. Standard 16-bit counter using GRP feedback.

1. For device migration considerations, these NC pins are GND pins for I/O banks in ispMACH 4128V devices.

2. For device migration considerations, these NC pins are input signal pins in ispMACH 4256V devices.

Note: VCC, VCCO and GND are tied together to their respective common signal on the package substrate. See Power Supply and NC Connections table for VCC/ VCCO/GND pin definitions.

## Part Number Description

1. For automotive AEC-Q100 compliant devices, refer to the LA-ispMACH 4000V/Z Automotive Family Data Sheet (DS1017).

2. Use ftBGA package. fpBGA package devices have been discontinued via PCN#14A-07.
