**Understanding Embedded - CPLDs (Complex Programmable Logic Devices)** 

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

#### **Applications of Embedded - CPLDs**

| Details                         |   |
|---------------------------------|---|
| Product Status                  | Obsolete  |
| Programmable Type               | In System Programmable  |
| Delay Time tpd(1) Max           | 3 ns  |
| Voltage Supply - Internal       | 1.65V ~ 1.95V   |
| Number of Logic Elements/Blocks | 16  |
| Number of Macrocells            | 256   |
| Number of Gates                 | -   |
| Number of I/O                   | 160   |
| Operating Temperature           | 0°C ~ 90°C (TJ)   |
| Mounting Type                   | Surface Mount   |
| Package / Case                  | 256-LBGA  |
| Supplier Device Package         | 256-FTBGA (17x17)   |

# ispMACH 4000 Introduction

The high performance ispMACH 4000 family from Lattice offers a SuperFAST CPLD solution. The family is a blend of Lattice's two most popular architectures: the ispLSI® 2000 and ispMACH 4A. Retaining the best of both families, the ispMACH 4000 architecture focuses on significant innovations to combine the highest performance with low power in a flexible CPLD family.

The ispMACH 4000 combines high speed and low power with the flexibility needed for ease of design. With its robust Global Routing Pool and Output Routing Pool, this family delivers excellent First-Time-Fit, timing predictability, routing, pin-out retention and density migration.

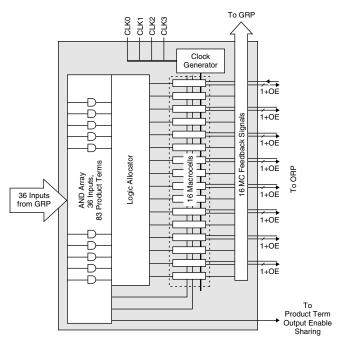

The ispMACH 4000 family offers densities ranging from 32 to 512 macrocells. There are multiple density-I/O combinations in Thin Quad Flat Pack (TQFP), Chip Scale BGA (csBGA) and Fine Pitch Thin BGA (ftBGA) packages ranging from 44 to 256 pins/balls. Table 1 shows the macrocell, package and I/O options, along with other key parameters.

The ispMACH 4000 family has enhanced system integration capabilities. It supports 3.3V (4000V), 2.5V (4000B) and 1.8V (4000C/Z) supply voltages and 3.3V, 2.5V and 1.8V interface voltages. Additionally, inputs can be safely driven up to 5.5V when an I/O bank is configured for 3.3V operation, making this family 5V tolerant. The ispMACH 4000 also offers enhanced I/O features such as slew rate control, PCI compatibility, bus-keeper latches, pull-up resistors, pull-down resistors, open drain outputs and hot socketing. The ispMACH 4000 family members are 3.3V/ 2.5V/1.8V in-system programmable through the IEEE Standard 1532 interface. IEEE Standard 1149.1 boundary scan testing capability also allows product testing on automated test equipment. The 1532 interface signals TCK, TMS, TDI and TDO are referenced to  $V_{CC}$  (logic core).

#### Overview

The ispMACH 4000 devices consist of multiple 36-input, 16-macrocell Generic Logic Blocks (GLBs) interconnected by a Global Routing Pool (GRP). Output Routing Pools (ORPs) connect the GLBs to the I/O Blocks (IOBs), which contain multiple I/O cells. This architecture is shown in Figure 1.

Figure 2. Generic Logic Block

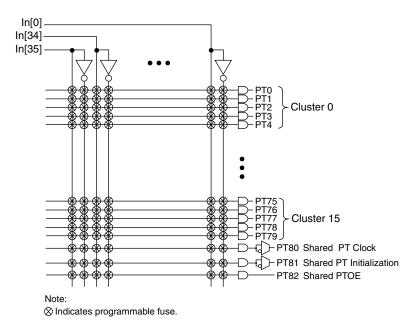

#### **AND Array**

The programmable AND Array consists of 36 inputs and 83 output product terms. The 36 inputs from the GRP are used to form 72 lines in the AND Array (true and complement of the inputs). Each line in the array can be connected to any of the 83 output product terms via a wired-AND. Each of the 80 logic product terms feed the logic allocator with the remaining three control product terms feeding the Shared PT Clock, Shared PT Initialization and Shared PT OE. The Shared PT Clock and Shared PT Initialization signals can optionally be inverted before being fed to the macrocells.

Every set of five product terms from the 80 logic product terms forms a product term cluster starting with PT0. There is one product term cluster for every macrocell in the GLB. Figure 3 is a graphical representation of the AND Array.

Figure 3. AND Array

#### **Enhanced Logic Allocator**

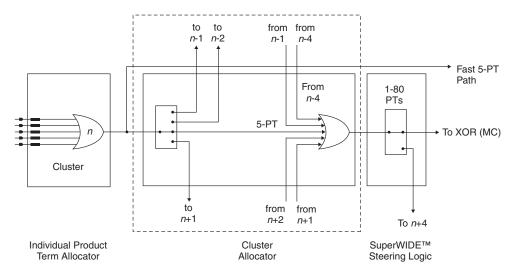

Within the logic allocator, product terms are allocated to macrocells in product term clusters. Each product term cluster is associated with a macrocell. The cluster size for the ispMACH 4000 family is 4+1 (total 5) product terms. The software automatically considers the availability and distribution of product term clusters as it fits the functions within a GLB. The logic allocator is designed to provide three speed paths: 5-PT fast bypass path, 20-PT Speed Locking path and an up to 80-PT path. The availability of these three paths lets designers trade timing variability for increased performance.

The enhanced Logic Allocator of the ispMACH 4000 family consists of the following blocks:

- Product Term Allocator
- Cluster Allocator
- Wide Steering Logic

Figure 4 shows a macrocell slice of the Logic Allocator. There are 16 such slices in the GLB.

Figure 4. Macrocell Slice

#### **Product Term Allocator**

The product term allocator assigns product terms from a cluster to either logic or control applications as required by the design being implemented. Product terms that are used as logic are steered into a 5-input OR gate associated with the cluster. Product terms that used for control are steered either to the macrocell or I/O cell associated with the cluster. Table 3 shows the available functions for each of the five product terms in the cluster. The OR gate output connects to the associated I/O cell, providing a fast path for narrow combinatorial functions, and to the logic allocator.

Table 3. Individual PT Steering

| Product Term   | Logic    | Control   |
|----------------|----------|---|
| PT <i>n</i>    | Logic PT | Single PT for XOR/OR  |
| PT <i>n</i> +1 | Logic PT | Individual Clock (PT Clock)   |
| PT <i>n</i> +2 | Logic PT | Individual Initialization or Individual Clock Enable (PT Initialization/CE) |
| PT <i>n</i> +3 | Logic PT | Individual Initialization (PT Initialization)                               |
| PT <i>n</i> +4 | Logic PT | Individual OE (PTOE)  |

#### **Cluster Allocator**

The cluster allocator allows clusters to be steered to neighboring macrocells, thus allowing the creation of functions with more product terms. Table 4 shows which clusters can be steered to which macrocells. Used in this manner, the cluster allocator can be used to form functions of up to 20 product terms. Additionally, the cluster allocator accepts inputs from the wide steering logic. Using these inputs, functions up to 80 product terms can be created.

Table 4. Available Clusters for Each Macrocell

| Macrocell | Available Clusters |     |     |     |  |  |
|-----------|--------------------|-----|-----|-----|--|--|
| M0        | _                  | C0  | C1  | C2  |  |  |
| M1        | C0                 | C1  | C2  | C3  |  |  |
| M2        | C1                 | C2  | C3  | C4  |  |  |
| M3        | C2                 | C3  | C4  | C5  |  |  |
| M4        | C3                 | C4  | C5  | C6  |  |  |
| M5        | C4                 | C5  | C6  | C7  |  |  |
| M6        | C5                 | C6  | C7  | C8  |  |  |
| M7        | C6                 | C7  | C8  | C9  |  |  |
| M8        | C7                 | C8  | C9  | C10 |  |  |
| M9        | C8                 | C9  | C10 | C11 |  |  |
| M10       | C9                 | C10 | C11 | C12 |  |  |
| M11       | C10                | C11 | C12 | C13 |  |  |
| M12       | C11                | C12 | C13 | C14 |  |  |
| M13       | C12                | C13 | C14 | C15 |  |  |
| M14       | C13                | C14 | C15 | _   |  |  |
| M15       | C14                | C15 | _   | _   |  |  |

#### Wide Steering Logic

The wide steering logic allows the output of the cluster allocator n to be connected to the input of the cluster allocator n+4. Thus, cluster chains can be formed with up to 80 product terms, supporting wide product term functions and allowing performance to be increased through a single GLB implementation. Table 5 shows the product term chains.

Table 7. ORP Combinations for I/O Blocks with 16 I/Os

| I/O Cell | Available Macrocells                 |
|----------|--------------------------------------|
| I/O 0    | M0, M1, M2, M3, M4, M5, M6, M7       |
| I/O 1    | M1, M2, M3, M4, M5, M6, M7, M8       |
| I/O 2    | M2, M3, M4, M5, M6, M7, M8, M9       |
| I/O 3    | M3, M4, M5, M6, M7, M8, M9, M10      |
| I/O 4    | M4, M5, M6, M7, M8, M9, M10, M11     |
| I/O 5    | M5, M6, M7, M8, M9, M10, M11, M12    |
| I/O 6    | M6, M7, M8, M9, M10, M11, M12, M13   |
| I/O 7    | M7, M8, M9, M10, M11, M12, M13, M14  |
| I/O 8    | M8, M9, M10, M11, M12, M13, M14, M15 |
| I/O 9    | M9, M10, M11, M12, M13, M14, M15, M0 |
| I/O 10   | M10, M11, M12, M13, M14, M15, M0, M1 |
| I/O 11   | M11, M12, M13, M14, M15, M0, M1, M2  |
| I/O 12   | M12, M13, M14, M15, M0, M1, M2, M3   |
| I/O 13   | M13, M14, M15, M0, M1, M2, M3, M4    |
| I/O 14   | M14, M15, M0, M1, M2, M3, M4, M5     |
| I/O 15   | M15, M0, M1, M2, M3, M4, M5, M6      |

#### Table 8. ORP Combinations for I/O Blocks with 4 I/Os

| I/O Cell | Available Macrocells                 |  |  |  |  |
|----------|--------------------------------------|--|--|--|--|
| I/O 0    | M0, M1, M2, M3, M4, M5, M6, M7       |  |  |  |  |
| I/O 1    | M4, M5, M6, M7, M8, M9, M10, M11     |  |  |  |  |
| I/O 2    | M8, M9, M10, M11, M12, M13, M14, M15 |  |  |  |  |
| I/O 3    | M12, M13, M14, M15, M0, M1, M2, M3   |  |  |  |  |

#### Table 9. ORP Combinations for I/O Blocks with 10 I/Os

| I/O Cell | Available Macrocells                 |
|----------|--------------------------------------|
| I/O 0    | M0, M1, M2, M3, M4, M5, M6, M7       |
| I/O 1    | M2, M3, M4, M5, M6, M7, M8, M9       |
| I/O 2    | M4, M5, M6, M7, M8, M9, M10, M11     |
| I/O 3    | M6, M7, M8, M9, M10, M11, M12, M13   |
| I/O 4    | M8, M9, M10, M11, M12, M13, M14, M15 |
| I/O 5    | M10, M11, M12, M13, M14, M15, M0, M1 |
| I/O 6    | M12, M13, M14, M15, M0, M1, M2, M3   |
| I/O 7    | M14, M15, M0, M1, M2, M3, M4, M5     |
| I/O 8    | M2, M3, M4, M5, M6, M7, M8, M9       |
| I/O 9    | M10, M11, M12, M13, M14, M15, M0, M1 |

### **IEEE 1532-Compliant In-System Programming**

Programming devices in-system provides a number of significant benefits including: rapid prototyping, lower inventory levels, higher quality and the ability to make in-field modifications. All ispMACH 4000 devices provide In-System Programming (ISP™) capability through the Boundary Scan Test Access Port. This capability has been implemented in a manner that ensures that the port remains complaint to the IEEE 1149.1 standard. By using IEEE 1149.1 as the communication interface through which ISP is achieved, users get the benefit of a standard, well-defined interface. All ispMACH 4000 devices are also compliant with the IEEE 1532 standard.

The ispMACH 4000 devices can be programmed across the commercial temperature and voltage range. The PC-based Lattice software facilitates in-system programming of ispMACH 4000 devices. The software takes the JEDEC file output produced by the design implementation software, along with information about the scan chain, and creates a set of vectors used to drive the scan chain. The software can use these vectors to drive a scan chain via the parallel port of a PC. Alternatively, the software can output files in formats understood by common automated test equipment. This equipment can then be used to program ispMACH 4000 devices during the testing of a circuit board.

## **User Electronic Signature**

The User Electronic Signature (UES) allows the designer to include identification bits or serial numbers inside the device, stored in E<sup>2</sup>CMOS memory. The ispMACH 4000 device contains 32 UES bits that can be configured by the user to store unique data such as ID codes, revision numbers or inventory control codes.

## **Security Bit**

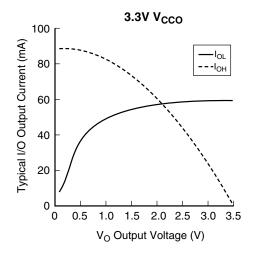

A programmable security bit is provided on the ispMACH 4000 devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

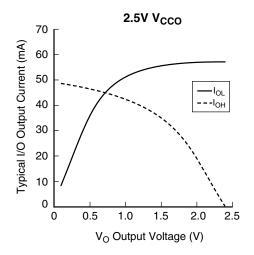

# **Hot Socketing**

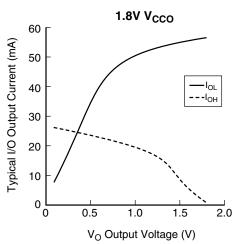

The ispMACH 4000 devices are well-suited for applications that require hot socketing capability. Hot socketing a device requires that the device, during power-up and down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of I/O pin loading be minimal on active signals. The isp-MACH 4000 devices provide this capability for input voltages in the range 0V to 3.0V.

# **Density Migration**

The ispMACH 4000 family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is possible to shift a lower utilization design targeted for a high density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

<sup>1.</sup> Timing numbers are based on default LVCMOS 1.8 I/O buffers. Use timing adjusters provided to calculate other standards.

Timing v.2.2

<sup>2.</sup> Measured using standard switching GRP loading of 1 and 1 output switching.

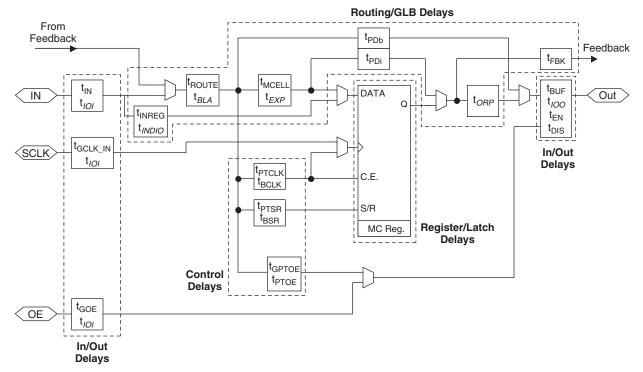

<sup>3.</sup> Pulse widths and clock widths less than minimum will cause unknown behavior.

<sup>4.</sup> Standard 16-bit counter using GRP feedback.

# **Timing Model**

The task of determining the timing through the ispMACH 4000 family, like any CPLD, is relatively simple. The timing model provided in Figure 11 shows the specific delay paths. Once the implementation of a given function is determined either conceptually or from the software report file, the delay path of the function can easily be determined from the timing model. The Lattice design tools report the timing delays based on the same timing model for a particular design. Note that the internal timing parameters are given for reference only, and are not tested. The external timing parameters are tested and guaranteed for every device. For more information on the timing model and usage, refer to TN1004, ispMACH 4000 Timing Model Design and Usage Guidelines.

Figure 11. ispMACH 4000 Timing Model

Note: Italicized items are optional delay adders.
