## Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

## Applications of Embedded - CPLDs

### Details

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	7.5 ns
Voltage Supply - Internal	1.65V ~ 1.95V
Number of Logic Elements/Blocks	16
Number of Macrocells	256
Number of Gates	-
Number of I/O	128
Operating Temperature	0°C ~ 90°C (TJ)
Mounting Type	Surface Mount
Package / Case	256-LBGA
Supplier Device Package	256-FTBGA (17x17)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4256c-75ft256ac">https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4256c-75ft256ac</a>

**Figure 2. Generic Logic Block**

## AND Array

The programmable AND Array consists of 36 inputs and 83 output product terms. The 36 inputs from the GRP are used to form 72 lines in the AND Array (true and complement of the inputs). Each line in the array can be connected to any of the 83 output product terms via a wired-AND. Each of the 80 logic product terms feed the logic allocator with the remaining three control product terms feeding the Shared PT Clock, Shared PT Initialization and Shared PT OE. The Shared PT Clock and Shared PT Initialization signals can optionally be inverted before being fed to the macrocells.

Every set of five product terms from the 80 logic product terms forms a product term cluster starting with PT0. There is one product term cluster for every macrocell in the GLB. Figure 3 is a graphical representation of the AND Array.

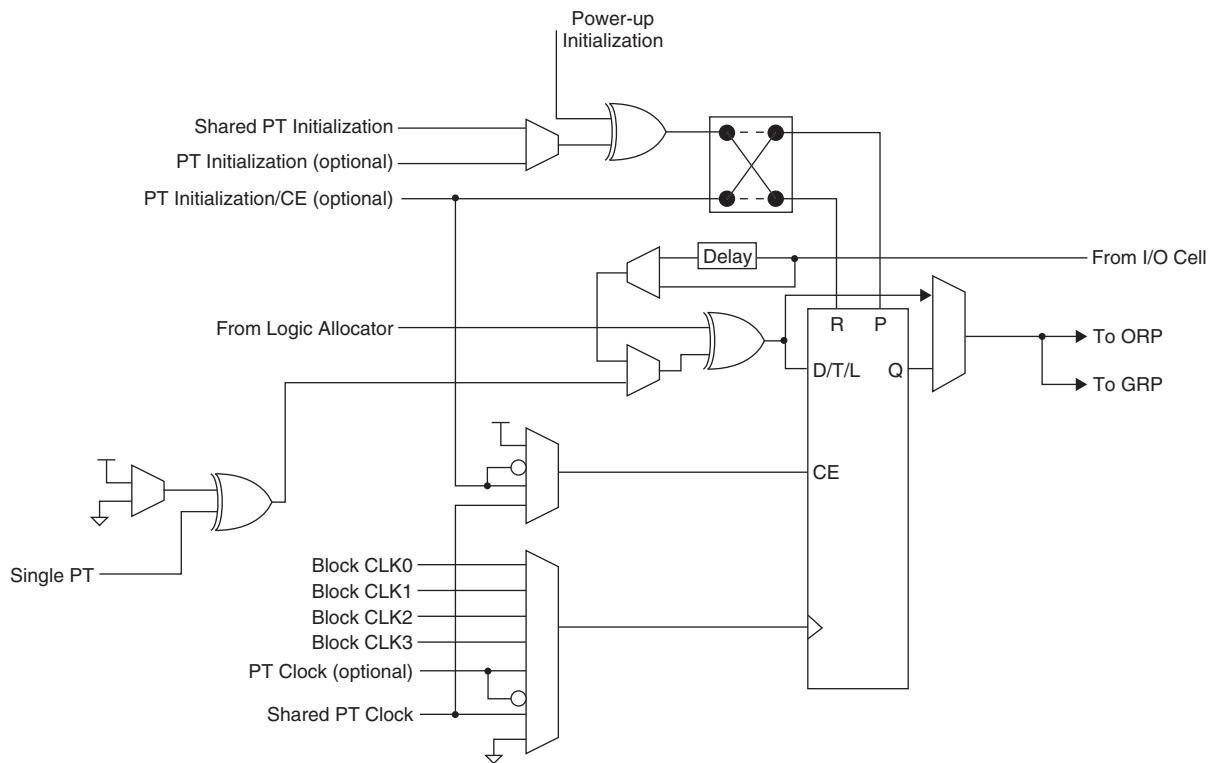

**Table 5. Product Term Expansion Capability**

Expansion Chains	Macrocells Associated with Expansion Chain (with Wrap Around)	Max PT/Macrocell
Chain-0	M0 M4 M8 M12 M0	75
Chain-1	M1 M5 M9 M13 M1	80
Chain-2	M2 M6 M10 M14 M2	75
Chain-3	M3 M7 M11 M15 M3	70

Every time the super cluster allocator is used, there is an incremental delay of  $t_{EXP}$ . When the super cluster allocator is used, all destinations other than the one being steered to, are given the value of ground (i.e., if the super cluster is steered to M (n+4), then M (n) is ground).

## Macrocell

The 16 macrocells in the GLB are driven by the 16 outputs from the logic allocator. Each macrocell contains a programmable XOR gate, a programmable register/latch, along with routing for the logic and control functions. Figure 5 shows a graphical representation of the macrocell. The macrocells feed the ORP and GRP. A direct input from the I/O cell allows designers to use the macrocell to construct high-speed input registers. A programmable delay in this path allows designers to choose between the fastest possible set-up time and zero hold time.

**Figure 5. Macrocell**

## Enhanced Clock Multiplexer

The clock input to the flip-flop can select any of the four block clocks along with the shared PT clock, and true and complement forms of the optional individual term clock. An 8:1 multiplexer structure is used to select the clock. The eight sources for the clock multiplexer are as follows:

- Block CLK0
- Block CLK1

## IEEE 1532-Compliant In-System Programming

Programming devices in-system provides a number of significant benefits including: rapid prototyping, lower inventory levels, higher quality and the ability to make in-field modifications. All ispMACH 4000 devices provide In-System Programming (ISP™) capability through the Boundary Scan Test Access Port. This capability has been implemented in a manner that ensures that the port remains complaint to the IEEE 1149.1 standard. By using IEEE 1149.1 as the communication interface through which ISP is achieved, users get the benefit of a standard, well-defined interface. All ispMACH 4000 devices are also compliant with the IEEE 1532 standard.

The ispMACH 4000 devices can be programmed across the commercial temperature and voltage range. The PC-based Lattice software facilitates in-system programming of ispMACH 4000 devices. The software takes the JEDEC file output produced by the design implementation software, along with information about the scan chain, and creates a set of vectors used to drive the scan chain. The software can use these vectors to drive a scan chain via the parallel port of a PC. Alternatively, the software can output files in formats understood by common automated test equipment. This equipment can then be used to program ispMACH 4000 devices during the testing of a circuit board.

## User Electronic Signature

The User Electronic Signature (UES) allows the designer to include identification bits or serial numbers inside the device, stored in E<sup>2</sup>CMOS memory. The ispMACH 4000 device contains 32 UES bits that can be configured by the user to store unique data such as ID codes, revision numbers or inventory control codes.

## Security Bit

A programmable security bit is provided on the ispMACH 4000 devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

## Hot Socketing

The ispMACH 4000 devices are well-suited for applications that require hot socketing capability. Hot socketing a device requires that the device, during power-up and down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of I/O pin loading be minimal on active signals. The ispMACH 4000 devices provide this capability for input voltages in the range 0V to 3.0V.

## Density Migration

The ispMACH 4000 family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is possible to shift a lower utilization design targeted for a high density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

**ispMACH 4000V/B/C External Switching Characteristics (Cont.)****Over Recommended Operating Conditions**

Parameter	Description <sup>1, 2, 3</sup>	-5		-75		-10		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
t <sub>PD</sub>	5-PT bypass combinatorial propagation delay	—	5.0	—	7.5	—	10.0	ns
t <sub>PD_MG</sub>	20-PT combinatorial propagation delay through macrocell	—	5.5	—	8.0	—	10.5	ns
t <sub>S</sub>	GLB register setup time before clock	3.0	—	4.5	—	5.5	—	ns

f <sub>MAX</sub> <sup>4</sup>	Clock frequency with internal feedback	—	227	—	168	—	125	MHz
f <sub>MAX</sub> (Ext.)	Clock frequency with external feedback, [1/ (t <sub>S</sub> + t <sub>CO</sub> )]	—	156	—	111	—	86	MHz

1. Timing numbers are based on default LVC MOS 1.8 I/O buffers. Use timing adjusters provided to calculate other standards.

Timing v.3.2

2. Measured using standard switching circuit, assuming GRP loading of 1 and 1 output switching.

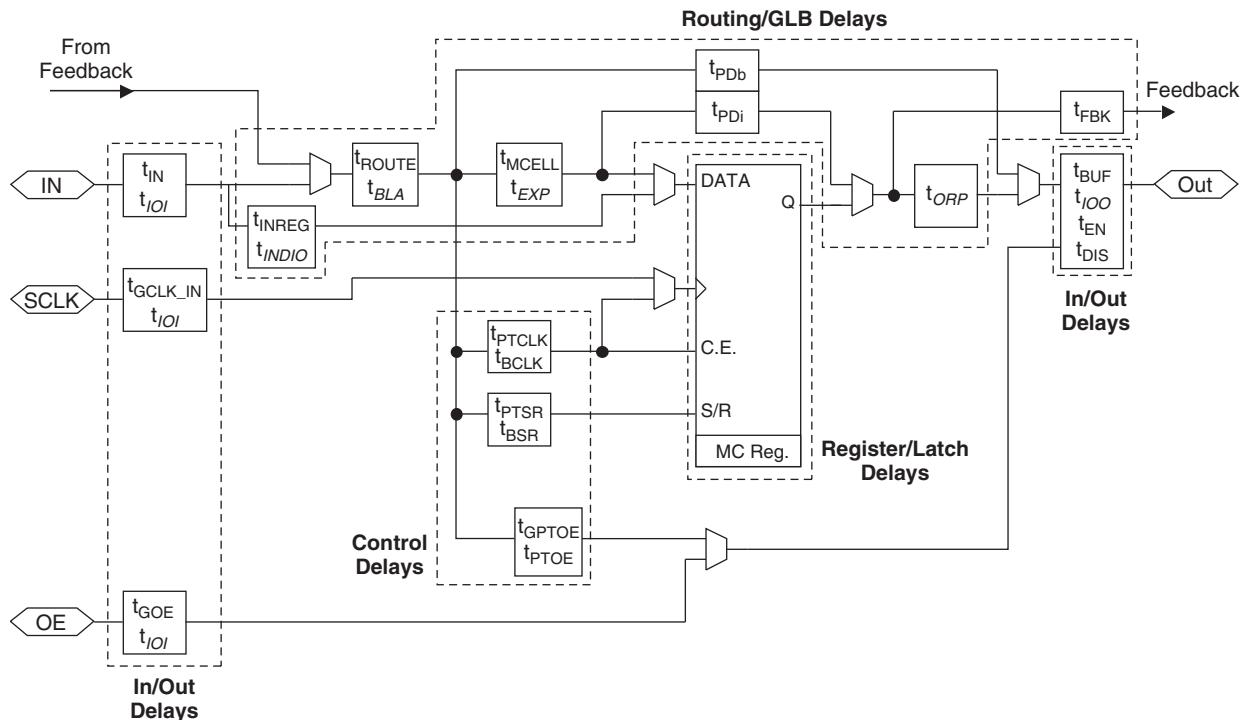

3. Pulse widths and clock widths less than minimum will cause unknown behavior.

4. Standard 16-bit counter using GRP feedback.

## Timing Model

The task of determining the timing through the ispMACH 4000 family, like any CPLD, is relatively simple. The timing model provided in Figure 11 shows the specific delay paths. Once the implementation of a given function is determined either conceptually or from the software report file, the delay path of the function can easily be determined from the timing model. The Lattice design tools report the timing delays based on the same timing model for a particular design. Note that the internal timing parameters are given for reference only, and are not tested. The external timing parameters are tested and guaranteed for every device. For more information on the timing model and usage, refer to TN1004, [ispMACH 4000 Timing Model Design and Usage Guidelines](#).

**Figure 11. ispMACH 4000 Timing Model**

## Revision History (Cont.)

Date	Version	Change Summary
January 2004	20z	ispMACH 4000Z data sheet status changed from preliminary to final. Documents production release of the ispMACH 4256Z device.
		Added new feature - ispMACH 4000Z supports operation down to 1.6V.
		Added lead-free packaging ordering part numbers for the ispMACH 4000Z/C/V devices.
April 2004	21z	Updated $I_{PU}$ (I/O Weak Pull-up Resistor Current) max. specification for the ispMACH 4000V/B/C; -150 $\mu$ A to -200 $\mu$ A.
November 2004	22z	Added User Electronic Signature section.
		Added ispMACH 4000B (2.5V) Lead-Free Ordering Part Numbers.
December 2004	22z.1	Updated Further Information section.
February 2006	22z.2	Clarification to ispMACH 4000Z Input Leakage ( $I_{IH}$ ) specification.
March 2007	22.3	Updated ispMACH 4000 Introduction section.
		Updated Signal Descriptions table.
June 2007	22.4	Updated Features bullets to include reference to "LA" automotive data sheet under the "Broad Device Offering" bullet.
		Added footnote 1 to Part Number Description to reference the "LA" automotive data sheet.
		Changed device temperature references from 'Automotive' to "Extended Temperature" for non-AEC-Q100 qualified devices.
November 2007	23.0	Added 256-ftBGA package Ordering Part Number information per PCN#14A-07.
May 2009	23.1	Correction to $t_{CW}$ , $t_{GW}$ , $t_{WIR}$ and $f_{MAX}$ parameters in ispMACH 4000Z External Switching Characteristics table.
		Correction to $t_{CW}$ , $t_{GW}$ , $t_{WIR}$ and $f_{MAX}$ parameters in ispMACH 4000V/B/C External Switching Characteristics table.
