### Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

### Applications of Embedded - CPLDs

#### Details

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	7.5 ns
Voltage Supply - Internal	3V ~ 3.6V
Number of Logic Elements/Blocks	16
Number of Macrocells	256
Number of Gates	-
Number of I/O	96
Operating Temperature	-40°C ~ 105°C (Tj)
Mounting Type	Surface Mount
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4256v-75t144i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4256v-75t144i</a>

## Product Term Allocator

The product term allocator assigns product terms from a cluster to either logic or control applications as required by the design being implemented. Product terms that are used as logic are steered into a 5-input OR gate associated with the cluster. Product terms that used for control are steered either to the macrocell or I/O cell associated with the cluster. Table 3 shows the available functions for each of the five product terms in the cluster. The OR gate output connects to the associated I/O cell, providing a fast path for narrow combinatorial functions, and to the logic allocator.

**Table 3. Individual PT Steering**

Product Term	Logic	Control
PT $n$	Logic PT	Single PT for XOR/OR
PT $n+1$	Logic PT	Individual Clock (PT Clock)
PT $n+2$	Logic PT	Individual Initialization or Individual Clock Enable (PT Initialization/CE)
PT $n+3$	Logic PT	Individual Initialization (PT Initialization)
PT $n+4$	Logic PT	Individual OE (PTOE)

## Cluster Allocator

The cluster allocator allows clusters to be steered to neighboring macrocells, thus allowing the creation of functions with more product terms. Table 4 shows which clusters can be steered to which macrocells. Used in this manner, the cluster allocator can be used to form functions of up to 20 product terms. Additionally, the cluster allocator accepts inputs from the wide steering logic. Using these inputs, functions up to 80 product terms can be created.

**Table 4. Available Clusters for Each Macrocell**

Macrocell	Available Clusters			
M0	—	C0	C1	C2
M1	C0	C1	C2	C3
M2	C1	C2	C3	C4
M3	C2	C3	C4	C5
M4	C3	C4	C5	C6
M5	C4	C5	C6	C7
M6	C5	C6	C7	C8
M7	C6	C7	C8	C9
M8	C7	C8	C9	C10
M9	C8	C9	C10	C11
M10	C9	C10	C11	C12
M11	C10	C11	C12	C13
M12	C11	C12	C13	C14
M13	C12	C13	C14	C15
M14	C13	C14	C15	—
M15	C14	C15	—	—

## Wide Steering Logic

The wide steering logic allows the output of the cluster allocator  $n$  to be connected to the input of the cluster allocator  $n+4$ . Thus, cluster chains can be formed with up to 80 product terms, supporting wide product term functions and allowing performance to be increased through a single GLB implementation. Table 5 shows the product term chains.

**Table 5. Product Term Expansion Capability**

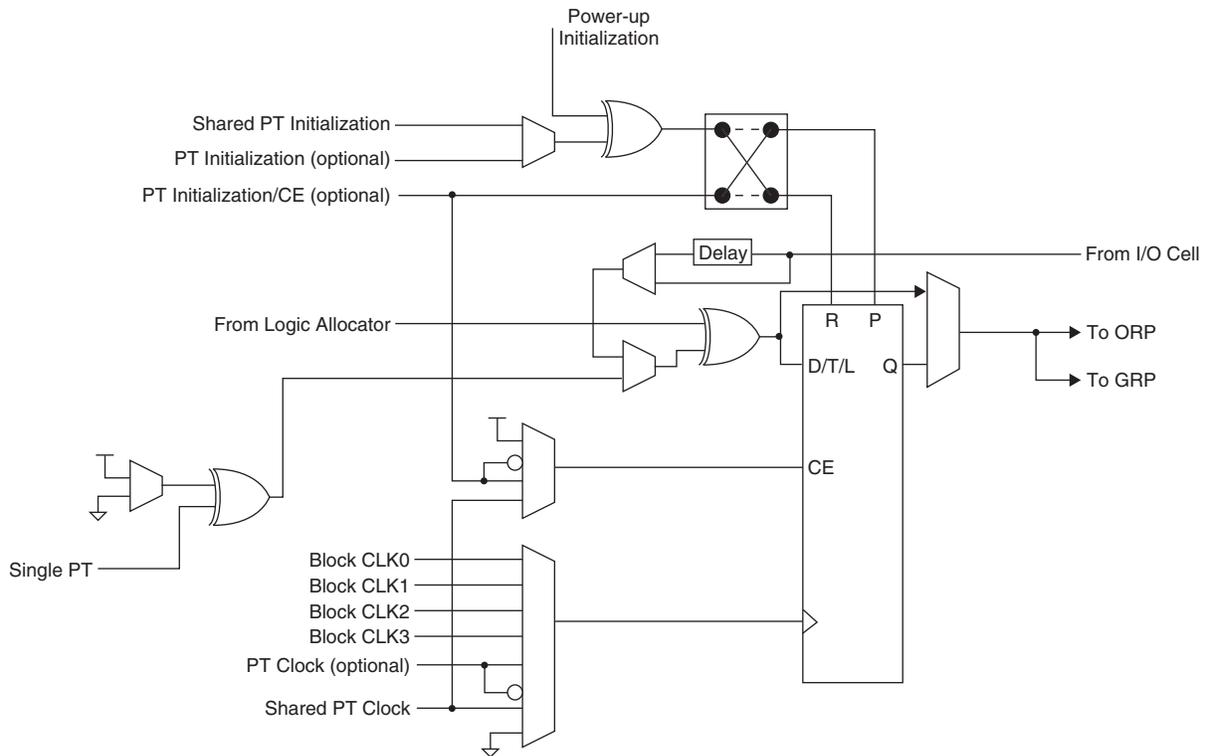

Expansion Chains	Macrocells Associated with Expansion Chain (with Wrap Around)	Max PT/Macrocell
Chain-0	M0 M4 M8 M12 M0	75
Chain-1	M1 M5 M9 M13 M1	80
Chain-2	M2 M6 M10 M14 M2	75
Chain-3	M3 M7 M11 M15 M3	70

Every time the super cluster allocator is used, there is an incremental delay of  $t_{EXP}$ . When the super cluster allocator is used, all destinations other than the one being steered to, are given the value of ground (i.e., if the super cluster is steered to M (n+4), then M (n) is ground).

**Macrocell**

The 16 macrocells in the GLB are driven by the 16 outputs from the logic allocator. Each macrocell contains a programmable XOR gate, a programmable register/latch, along with routing for the logic and control functions. Figure 5 shows a graphical representation of the macrocell. The macrocells feed the ORP and GRP. A direct input from the I/O cell allows designers to use the macrocell to construct high-speed input registers. A programmable delay in this path allows designers to choose between the fastest possible set-up time and zero hold time.

**Figure 5. Macrocell**

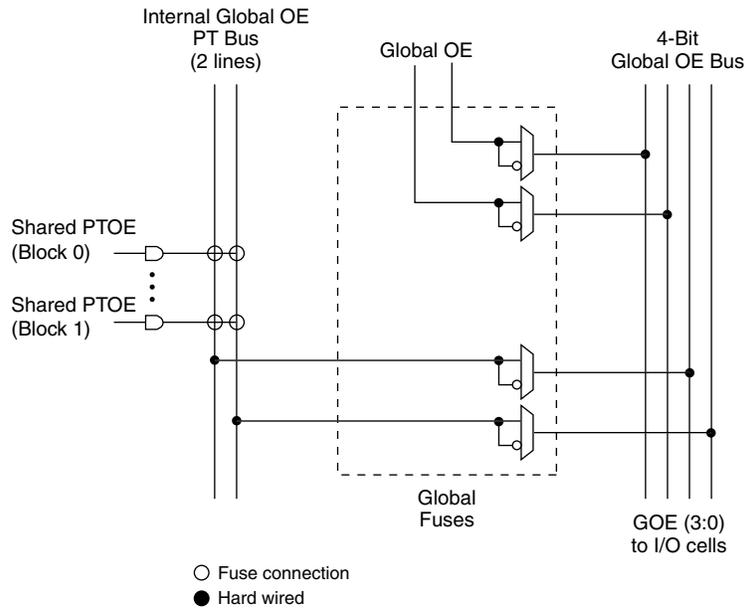

**Enhanced Clock Multiplexer**

The clock input to the flip-flop can select any of the four block clocks along with the shared PT clock, and true and complement forms of the optional individual term clock. An 8:1 multiplexer structure is used to select the clock. The eight sources for the clock multiplexer are as follows:

- Block CLK0
- Block CLK1

Figure 10. Global OE Generation for ispMACH 4032

## Zero Power/Low Power and Power Management

The ispMACH 4000 family is designed with high speed low power design techniques to offer both high speed and low power. With an advanced  $E^2$  low power cell and non sense-amplifier design approach (full CMOS logic approach), the ispMACH 4000 family offers SuperFAST pin-to-pin speeds, while simultaneously delivering low standby power without needing any “turbo bits” or other power management schemes associated with a traditional sense-amplifier approach.

The zero power ispMACH 4000Z is based on the 1.8V ispMACH 4000C family. With innovative circuit design changes, the ispMACH 4000Z family is able to achieve the industry’s “lowest static power”.

## IEEE 1149.1-Compliant Boundary Scan Testability

All ispMACH 4000 devices have boundary scan cells and are compliant to the IEEE 1149.1 standard. This allows functional testing of the circuit board on which the device is mounted through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test node data to be captured and shifted out for verification. In addition, these devices can be linked into a board-level serial scan path for more board-level testing. The test access port operates with an LVCMOS interface that corresponds to the power supply voltage.

## I/O Quick Configuration

To facilitate the most efficient board test, the physical nature of the I/O cells must be set before running any continuity tests. As these tests are fast, by nature, the overhead and time that is required for configuration of the I/Os’ physical nature should be minimal so that board test time is minimized. The ispMACH 4000 family of devices allows this by offering the user the ability to quickly configure the physical nature of the I/O cells. This quick configuration takes milliseconds to complete, whereas it takes seconds for the entire device to be programmed. Lattice’s ispVM<sup>®</sup> System programming software can either perform the quick configuration through the PC parallel port, or can generate the ATE or test vectors necessary for a third-party test system.

### Supply Current, ispMACH 4000V/B/C (Cont.)

Over Recommended Operating Conditions

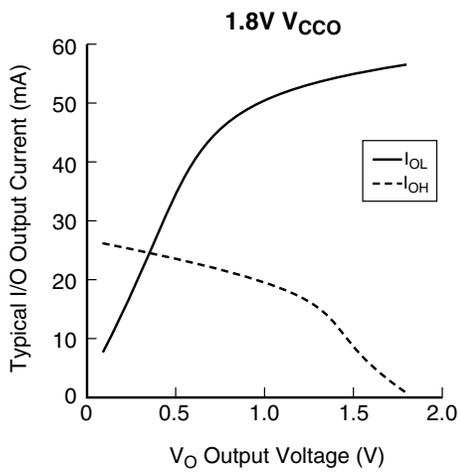

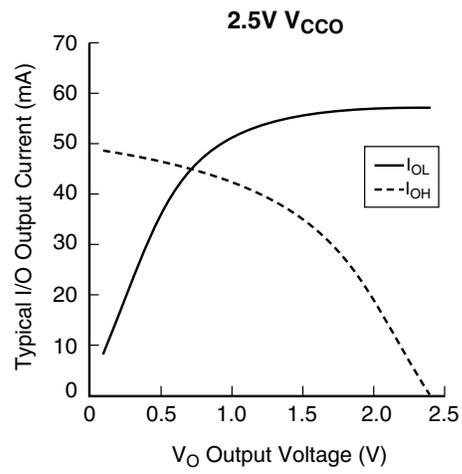

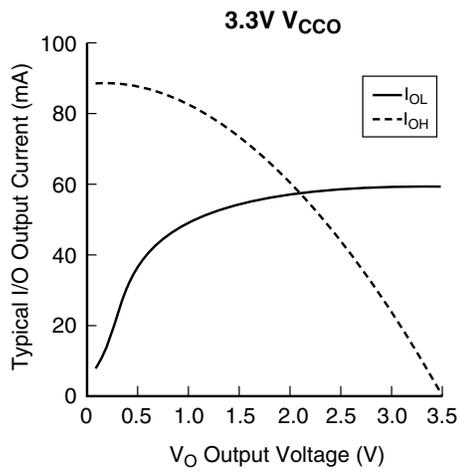

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
I <sub>CC</sub> <sup>4</sup>	Standby Power Supply Current	V <sub>CC</sub> = 3.3V	—	13	—	mA

LVC MOS18_out	t <sub>BUF</sub> , t <sub>EN</sub> , t <sub>DIS</sub>	Output configured as 1.8V buffer	—	0.00	—	0.00	—	0.00	ns
PCI_out	t <sub>BUF</sub> , t <sub>EN</sub> , t <sub>DIS</sub>	Output configured as PCI compatible buffer	—	0.20	—	0.20	—	0.20	ns
Slow Slew	t <sub>BUF</sub> , t <sub>EN</sub>	Output configured for slow slew rate	—	1.00	—	1.00	—	1.00	ns

Note: Open drain timing is the same as corresponding LVC MOS timing.

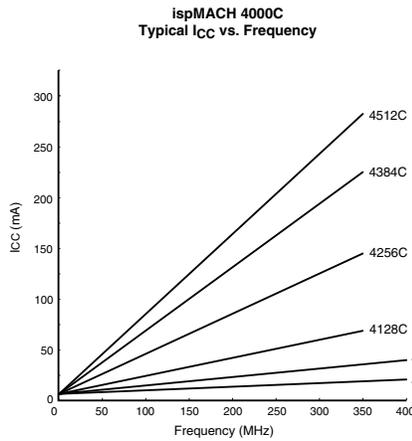

Timing v.2.2

1. Refer to TN1004, [ispMACH 4000 Timing Model Design and Usage Guidelines](#) for information regarding use of these adders.

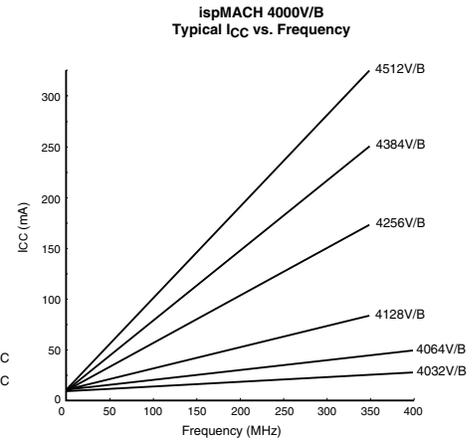

## Power Consumption

Note: The devices are configured with maximum number of 16-bit counters, typical current at 1.8V, 25°C.

Note: The devices are configured with maximum number of 16-bit counters, typical current at 1.8V, 25°C.

Note: The devices are configured with maximum number of 16-bit counters, typical current at 3.3V, 2.5V, 25°C.

### Signal Descriptions

Signal Names	Description	
TMS	Input – This pin is the IEEE 1149.1 Test Mode Select input, which is used to control the state machine.	
TCK	Input – This pin is the IEEE 1149.1 Test Clock input pin, used to clock through the state machine.	
TDI	Input – This pin is the IEEE 1149.1 Test Data In pin, used to load data.	
TDO	Output – This pin is the IEEE 1149.1 Test Data Out pin used to shift data out.	
GOE0/IO, GOE1/IO	These pins are configured to be either Global Output Enable Input or as general I/O pins.	
GND	Ground	
NC	Not Connected	
V <sub>CC</sub>	The power supply pins for logic core and JTAG port.	
CLK0/I, CLK1/I, CLK2/I, CLK3/I	These pins are configured to be either CLK input or as an input.	
V <sub>CC00</sub> , V <sub>CC01</sub>	The power supply pins for each I/O bank.	
yzz	Input/Output <sup>1</sup> – These are the general purpose I/O used by the logic array. y is GLB reference (alpha) and z is macrocell reference (numeric). z: 0-15.	
	ispMACH 4032	y: A-B
	ispMACH 4064	y: A-D
	ispMACH 4128	y: A-H
	ispMACH 4256	y: A-P
	ispMACH 4384	y: A-P, AX-HX
ispMACH 4512	y: A-P, AX-PX	

1. In some packages, certain I/Os are only available for use as inputs. See the signal connections table for details.

1. All grounds must be electrically connected at the board level. However, for the purposes of I/O current loading, grounds are associated with the bank shown.
2. Pin orientation follows the conventional order from pin 1 marking of the top side view and counter-clockwise.
3. Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.
