## Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

## Applications of Embedded - CPLDs

### Details

Product Status	Active
Programmable Type	In System Programmable
Delay Time tpd(1) Max	7.5 ns
Voltage Supply - Internal	3V ~ 3.6V
Number of Logic Elements/Blocks	16
Number of Macrocells	256
Number of Gates	-
Number of I/O	128
Operating Temperature	0°C ~ 90°C (TJ)
Mounting Type	Surface Mount
Package / Case	176-LQFP
Supplier Device Package	176-TQFP (24x24)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4256v-75tn176c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4256v-75tn176c</a>

- LVTTTL
- LVC MOS 3.3
- LVC MOS 2.5
- LVC MOS 1.8
- 3.3V PCI Compatible

All of the I/Os and dedicated inputs have the capability to provide a bus-keeper latch, Pull-up Resistor or Pull-down Resistor. A fourth option is to provide none of these. The selection is done on a global basis. The default in both hardware and software is such that when the device is erased or if the user does not specify, the input structure is configured to be a Pull-up Resistor.

Each ispMACH 4000 device I/O has an individually programmable output slew rate control bit. Each output can be individually configured for fast slew or slow slew. The typical edge rate difference between fast and slow slew setting is 20%. For high-speed designs with long, unterminated traces, the slow-slew rate will introduce fewer reflections, less noise and keep ground bounce to a minimum. For designs with short traces or well terminated lines, the fast slew rate can be used to achieve the highest speed.

### Global OE Generation

Most ispMACH 4000 family devices have a 4-bit wide Global OE Bus, except the ispMACH 4032 device that has a 2-bit wide Global OE Bus. This bus is derived from a 4-bit internal global OE PT bus and two dual purpose I/O or GOE pins. Each signal that drives the bus can optionally be inverted.

Each GLB has a block-level OE PT that connects to all bits of the Global OE PT bus with four fuses. Hence, for a 256-macrocell device (with 16 blocks), each line of the bus is driven from 16 OE product terms. Figures 9 and 10 show a graphical representation of the global OE generation.

**Figure 9. Global OE Generation for All Devices Except ispMACH 4032**

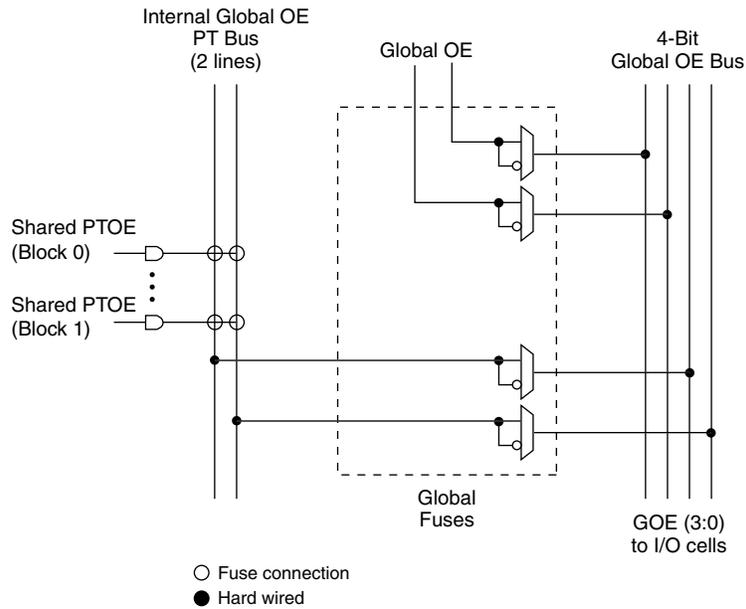

Figure 10. Global OE Generation for ispMACH 4032

## Zero Power/Low Power and Power Management

The ispMACH 4000 family is designed with high speed low power design techniques to offer both high speed and low power. With an advanced  $E^2$  low power cell and non sense-amplifier design approach (full CMOS logic approach), the ispMACH 4000 family offers SuperFAST pin-to-pin speeds, while simultaneously delivering low standby power without needing any “turbo bits” or other power management schemes associated with a traditional sense-amplifier approach.

The zero power ispMACH 4000Z is based on the 1.8V ispMACH 4000C family. With innovative circuit design changes, the ispMACH 4000Z family is able to achieve the industry’s “lowest static power”.

## IEEE 1149.1-Compliant Boundary Scan Testability

All ispMACH 4000 devices have boundary scan cells and are compliant to the IEEE 1149.1 standard. This allows functional testing of the circuit board on which the device is mounted through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test node data to be captured and shifted out for verification. In addition, these devices can be linked into a board-level serial scan path for more board-level testing. The test access port operates with an LVCMOS interface that corresponds to the power supply voltage.

## I/O Quick Configuration

To facilitate the most efficient board test, the physical nature of the I/O cells must be set before running any continuity tests. As these tests are fast, by nature, the overhead and time that is required for configuration of the I/Os’ physical nature should be minimal so that board test time is minimized. The ispMACH 4000 family of devices allows this by offering the user the ability to quickly configure the physical nature of the I/O cells. This quick configuration takes milliseconds to complete, whereas it takes seconds for the entire device to be programmed. Lattice’s ispVM<sup>®</sup> System programming software can either perform the quick configuration through the PC parallel port, or can generate the ATE or test vectors necessary for a third-party test system.

**ispMACH 4000V/B/C External Switching Characteristics (Cont.)**

Over Recommended Operating Conditions

Parameter	Description <sup>1, 2, 3</sup>	-5		-75		-10		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
t <sub>PD</sub>	5-PT bypass combinatorial propagation delay	—	5.0	—	7.5	—	10.0	ns
t <sub>PD_MC</sub>	20-PT combinatorial propagation delay through macrocell	—	5.5	—	8.0	—	10.5	ns
t <sub>S</sub>	GLB register setup time before clock	3.0	—	4.5	—	5.5	—	ns

LVC MOS18_out	t <sub>BUF</sub> , t <sub>EN</sub> , t <sub>DIS</sub>	Output configured as 1.8V buffer	—	0.00	—	0.00	—	0.00	ns
PCI_out	t <sub>BUF</sub> , t <sub>EN</sub> , t <sub>DIS</sub>	Output configured as PCI compatible buffer	—	0.20	—	0.20	—	0.20	ns
Slow Slew	t <sub>BUF</sub> , t <sub>EN</sub>	Output configured for slow slew rate	—	1.00	—	1.00	—	1.00	ns

Note: Open drain timing is the same as corresponding LVC MOS timing.

Timing v.2.2

1. Refer to TN1004, [ispMACH 4000 Timing Model Design and Usage Guidelines](#) for information regarding the use of these adders.

### Signal Descriptions

Signal Names	Description	
TMS	Input – This pin is the IEEE 1149.1 Test Mode Select input, which is used to control the state machine.	
TCK	Input – This pin is the IEEE 1149.1 Test Clock input pin, used to clock through the state machine.	
TDI	Input – This pin is the IEEE 1149.1 Test Data In pin, used to load data.	
TDO	Output – This pin is the IEEE 1149.1 Test Data Out pin used to shift data out.	
GOE0/IO, GOE1/IO	These pins are configured to be either Global Output Enable Input or as general I/O pins.	
GND	Ground	
NC	Not Connected	
V <sub>CC</sub>	The power supply pins for logic core and JTAG port.	
CLK0/I, CLK1/I, CLK2/I, CLK3/I	These pins are configured to be either CLK input or as an input.	
V <sub>CC00</sub> , V <sub>CC01</sub>	The power supply pins for each I/O bank.	
yzz	Input/Output <sup>1</sup> – These are the general purpose I/O used by the logic array. y is GLB reference (alpha) and z is macrocell reference (numeric). z: 0-15.	
	ispMACH 4032	y: A-B
	ispMACH 4064	y: A-D
	ispMACH 4128	y: A-H
	ispMACH 4256	y: A-P

1. All grounds must be electrically connected at the board level. However, for the purposes of I/O current loading, grounds are associated with the bank shown.
2. Pin orientation follows the conventional order from pin 1 marking of the top side view and counter-clockwise.
3. Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.

## Ordering Information

Note: ispMACH 4000 devices are all dual marked except the slowest commercial speed grade ispMACH 4000Z devices. For example, the commercial speed grade LC4128C-5T100C is also marked with the industrial grade -75I. The commercial grade is always one speed grade faster than the associated dual mark industrial grade. The slowest commercial speed grade ispMACH 4000Z devices are marked as commercial grade only.
