Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Figure 1. Functional Block Diagram

The I/Os in the ispMACH 4000 are split into two banks. Each bank has a separate I/O power supply. Inputs can support a variety of standards independent of the chip or bank power supply. Outputs support the standards compatible with the power supply provided to the bank. Support for a variety of standards helps designers implement designs in mixed voltage environments. In addition, 5V tolerant inputs are specified within an I/O bank that is connected to V_{CC0} of 3.0V to 3.6V for LVCMOS 3.3, LVTTTL and PCI interfaces.

ispMACH 4000 Architecture

There are a total of two GLBs in the ispMACH 4032, increasing to 32 GLBs in the ispMACH 4512. Each GLB has 36 inputs. All GLB inputs come from the GRP and all outputs from the GLB are brought back into the GRP to be connected to the inputs of any other GLB on the device. Even if feedback signals return to the same GLB, they still must go through the GRP. This mechanism ensures that GLBs communicate with each other with consistent and predictable delays. The outputs from the GLB are also sent to the ORP. The ORP then sends them to the associated I/O cells in the I/O block.

Generic Logic Block

The ispMACH 4000 GLB consists of a programmable AND array, logic allocator, 16 macrocells and a GLB clock generator. Macrocells are decoupled from the product terms through the logic allocator and the I/O pins are decoupled from macrocells through the ORP. Figure 2 illustrates the GLB.

Product Term Allocator

The product term allocator assigns product terms from a cluster to either logic or control applications as required by the design being implemented. Product terms that are used as logic are steered into a 5-input OR gate associated with the cluster. Product terms that used for control are steered either to the macrocell or I/O cell associated with the cluster. Table 3 shows the available functions for each of the five product terms in the cluster. The OR gate output connects to the associated I/O cell, providing a fast path for narrow combinatorial functions, and to the logic allocator.

Table 3. Individual PT Steering

Product Term	Logic	Control
PT n	Logic PT	Single PT for XOR/OR
PT $n+1$	Logic PT	Individual Clock (PT Clock)
PT $n+2$	Logic PT	Individual Initialization or Individual Clock Enable (PT Initialization/CE)
PT $n+3$	Logic PT	Individual Initialization (PT Initialization)
PT $n+4$	Logic PT	Individual OE (PTOE)

Cluster Allocator

The cluster allocator allows clusters to be steered to neighboring macrocells, thus allowing the creation of functions with more product terms. Table 4 shows which clusters can be steered to which macrocells. Used in this manner, the cluster allocator can be used to form functions of up to 20 product terms. Additionally, the cluster allocator accepts inputs from the wide steering logic. Using these inputs, functions up to 80 product terms can be created.

Table 4. Available Clusters for Each Macrocell

M13	C12	C13	C14	C15
M14	C13	C14	C15	—
M15	C14	C15	—	—

Wide Steering Logic

The wide steering logic allows the output of the cluster allocator n to be connected to the input of the cluster allocator $n+4$. Thus, cluster chains can be formed with up to 80 product terms, supporting wide product term functions and allowing performance to be increased through a single GLB implementation. Table 5 shows the product term chains.

ORP Bypass and Fast Output Multiplexers

The ORP bypass and fast-path output multiplexer is a 4:1 multiplexer and allows the 5-PT fast path to bypass the ORP and be connected directly to the pin with either the regular output or the inverted output. This multiplexer also allows the register output to bypass the ORP to achieve faster t_{CO} .

Output Enable Routing Multiplexers

The OE Routing Pool provides the corresponding local output enable (OE) product term to the I/O cell.

I/O Cell

The I/O cell contains the following programmable elements: output buffer, input buffer, OE multiplexer and bus maintenance circuitry. Figure 8 details the I/O cell.

Figure 8. I/O Cell

Each output supports a variety of output standards dependent on the V_{CCO} supplied to its I/O bank. Outputs can also be configured for open drain operation. Each input can be programmed to support a variety of standards, independent of the V_{CCO} supplied to its I/O bank. The I/O standards supported are:

Absolute Maximum Ratings^{1, 2, 3}

	ispMACH 4000C/Z (1.8V)	ispMACH 4000B (2.5V)	ispMACH 4000V (3.3V)
Supply Voltage (V_{CC})	-0.5 to 2.5V	-0.5 to 5.5V	-0.5 to 5.5V
Output Supply Voltage (V_{CCO})	-0.5 to 4.5V	-0.5 to 4.5V	-0.5 to 4.5V

Junction Temperature (T_j) with Power Applied	-55 to 150°C	-55 to 150°C	-55 to 150°C

1. Stress above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with Lattice [Thermal Management](#) document is required.
3. All voltages referenced to GND.
4. Undershoot of -2V and overshoot of (V_{IH} (MAX) + 2V), up to a total pin voltage of 6.0V, is permitted for a duration of < 20ns.
5. Maximum of 64 I/Os per device with $V_{IN} > 3.6V$ is allowed.

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tristated. It is not measured with the output driver active. Bus maintenance circuits are disabled.

2. 5V tolerant inputs and I/O should only be placed in banks where $3.0V \leq V_{CCO} \leq 3.6V$.

3. $T_A = 25^\circ C$, $f = 1.0MHz$

4. I_{IH} excursions of up to 1.5 μA maximum per pin above the spec limit may be observed for certain voltage conditions on no more than 10% of the device's I/O pins.

Revision History (Cont.)

Date	Version	Change Summary
January 2004	20z	ispMACH 4000Z data sheet status changed from preliminary to final. Documents production release of the ispMACH 4256Z device.
		Added new feature - ispMACH 4000Z supports operation down to 1.6V.
		Added lead-free packaging ordering part numbers for the ispMACH 4000Z/C/V devices.
April 2004	21z	Updated I_{PU} (I/O Weak Pull-up Resistor Current) max. specification for the ispMACH 4000V/B/C; -150 μ A to -200 μ A.
November 2004	22z	Added User Electronic Signature section.
		Added ispMACH 4000B (2.5V) Lead-Free Ordering Part Numbers.
December 2004	22z.1	Updated Further Information section.
February 2006	22z.2	Clarification to ispMACH 4000Z Input Leakage (I_{IH}) specification.
March 2007	22.3	Updated ispMACH 4000 Introduction section.
		Updated Signal Descriptions table.
June 2007	22.4	Updated Features bullets to include reference to “LA” automotive data sheet under the “Broad Device Offering” bullet.
		Added footnote 1 to Part Number Description to reference the “LA” automotive data sheet.
		Changed device temperature references from ‘Automotive’ to “Extended Temperature” for non-AEC-Q100 qualified devices.
November 2007	23.0	Added 256-ftBGA package Ordering Part Number information per PCN#14A-07.
May 2009	23.1	Correction to t_{CW} , t_{GW} , t_{WIR} and f_{MAX} parameters in ispMACH 4000Z External Switching Characteristics table.
		Correction to t_{CW} , t_{GW} , t_{WIR} and f_{MAX} parameters in ispMACH 4000V/B/C External Switching Characteristics table.
