

Welcome to [E-XFL.COM](#)

#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

#### Applications of "[Embedded - Microcontrollers](#)"

##### Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	10MHz
Connectivity	I <sup>2</sup> C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	22
Program Memory Size	14KB (8K x 14)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	368 x 8
Voltage - Supply (Vcc/Vdd)	4V ~ 6V
Data Converters	A/D 5x8b
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic16c76-10-so">https://www.e-xfl.com/product-detail/microchip-technology/pic16c76-10-so</a>

# **PIC16C7X**

**FIGURE 4-13:** PIR1 REGISTER PIC16C73/73A/74/74A/76/77 (ADDRESS 0Ch)

Example 4-1 shows the calling of a subroutine in page 1 of the program memory. This example assumes that PCLATH is saved and restored by the interrupt service routine (if interrupts are used).

### EXAMPLE 4-1: CALL OF A SUBROUTINE IN PAGE 1 FROM PAGE 0

```

ORG 0x500
BSF PCLATH,3 ;Select page 1 (800h-FFFh)
BCF PCLATH,4 ;Only on >4K devices
CALL SUB1_P1 ;Call subroutine in
              ;page 1 (800h-FFFh)
              ;
              ;
ORG 0x900
SUB1_P1:      ;called subroutine
              ;page 1 (800h-FFFh)
              ;
RETURN         ;return to Call subroutine
              ;in page 0 (000h-7FFh)

```

### 4.5 Indirect Addressing, INDF and FSR Registers

#### Applicable Devices

72	73	73A	74	74A	76	77
----	----	-----	----	-----	----	----

The INDF register is not a physical register. Addressing the INDF register will cause indirect addressing.

Indirect addressing is possible by using the INDF register. Any instruction using the INDF register actually accesses the register pointed to by the File Select Register, FSR. Reading the INDF register itself indirectly (FSR = '0') will read 00h. Writing to the INDF register indirectly results in a no-operation (although status bits may be affected). An effective 9-bit address is obtained by concatenating the 8-bit FSR register and the IRP bit (STATUS<7>), as shown in Figure 4-18.

A simple program to clear RAM locations 20h-2Fh using indirect addressing is shown in Example 4-2.

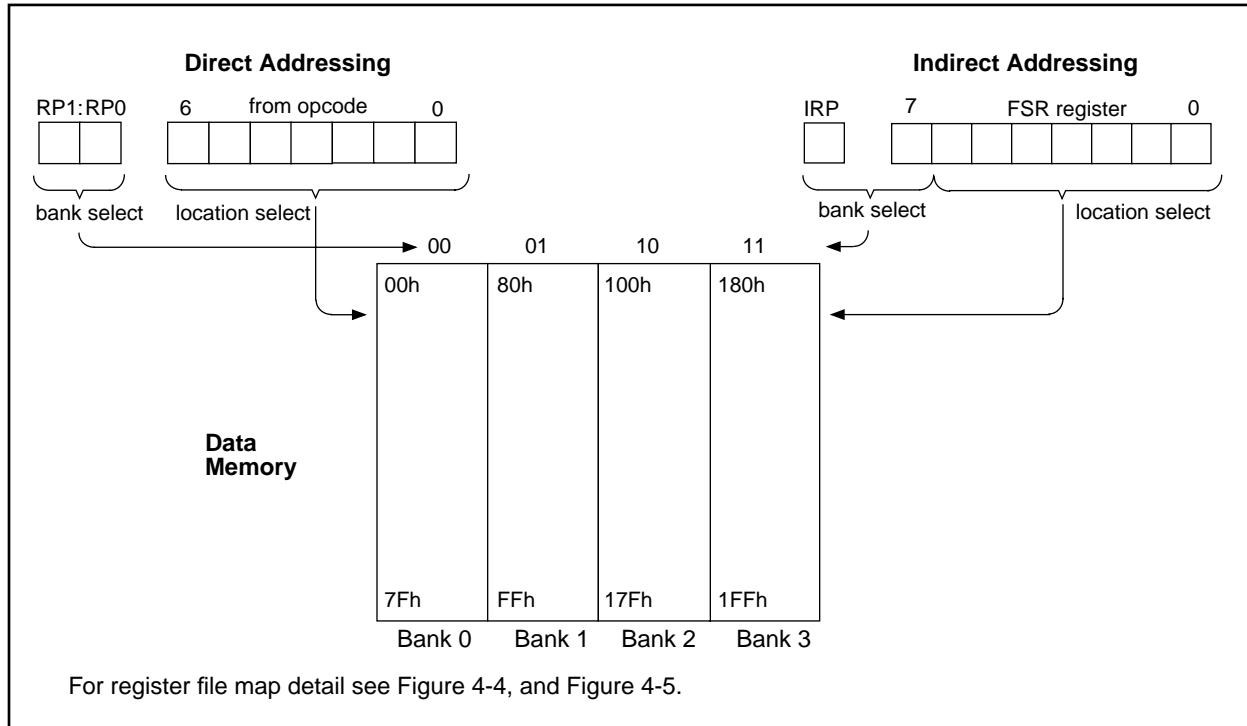

### EXAMPLE 4-2: INDIRECT ADDRESSING

```

        movlw 0x20    ;initialize pointer
        movwf FSR     ;to RAM
NEXT      clrf INDF   ;clear INDF register
          incf FSR,F ;inc pointer
          btfss FSR,4 ;all done?
          goto NEXT  ;no clear next
CONTINUE   :
                  ;yes continue

```

**FIGURE 4-18: DIRECT/INDIRECT ADDRESSING**

For register file map detail see Figure 4-4, and Figure 4-5.

## 5.2 PORTB and TRISB Registers

## **Applicable Devices**

72 73 73A 74 74A 76 77

PORTB is an 8-bit wide bi-directional port. The corresponding data direction register is TRISB. Setting a bit in the TRISB register puts the corresponding output driver in a hi-impedance input mode. Clearing a bit in the TRISB register puts the contents of the output latch on the selected pin(s).

## EXAMPLE 5-2: INITIALIZING PORTB

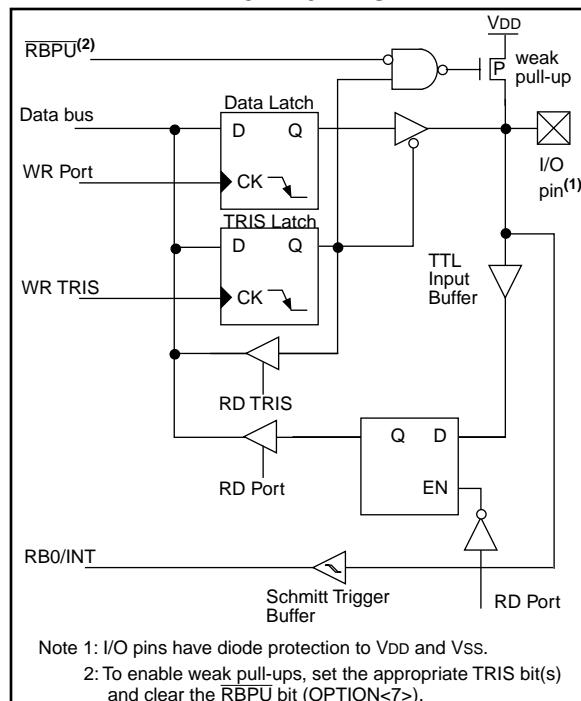

```

BCF    STATUS, RP0      ;
CLRWF PORTB           ; Initialize PORTB by
                        ; clearing output
                        ; data latches
BSF    STATUS, RP0      ; Select Bank 1
MOVLW  0xCF            ; Value used to
                        ; initialize data
                        ; direction
MOVWF  TRISB           ; Set RB<3:0> as inputs
                        ; RB<5:4> as outputs
                        ; RB<7:6> as inputs

```

Each of the PORTB pins has a weak internal pull-up. A single control bit can turn on all the pull-ups. This is performed by clearing bit  **$\overline{RBPU}$**  (OPTION<7>). The weak pull-up is automatically turned off when the port pin is configured as an output. The pull-ups are disabled on a Power-on Reset.

**FIGURE 5-3: BLOCK DIAGRAM OF RB3:RB0 PINS**

Four of PORTB's pins, RB7:RB4, have an interrupt on change feature. Only pins configured as inputs can cause this interrupt to occur (i.e. any RB7:RB4 pin configured as an output is excluded from the interrupt on change comparison). The input pins (of RB7:RB4) are compared with the old value latched on the last read of PORTB. The "mismatch" outputs of RB7:RB4 are OR'ed together to generate the RB Port Change Interrupt with flag bit RBIF (INTCON<0>).

This interrupt can wake the device from SLEEP. The user, in the interrupt service routine, can clear the interrupt in the following manner:

- a) Any read or write of PORTB. This will end the mismatch condition.
  - b) Clear flag bit RBIF.

A mismatch condition will continue to set flag bit RBIF. Reading PORTB will end the mismatch condition, and allow flag bit RBIF to be cleared.

This interrupt on mismatch feature, together with software configurable pull-ups on these four pins allow easy interface to a keypad and make it possible for wake-up on key-depression. Refer to the Embedded Control Handbook, "*Implementing Wake-Up on Key Stroke*" (AN552).

**Note:** For the PIC16C73/74, if a change on the I/O pin should occur when the read operation is being executed (start of the Q2 cycle), then interrupt flag bit RBIF may not get set.

The interrupt on change feature is recommended for wake-up on key depression operation and operations where PORTB is only used for the interrupt on change feature. Polling of PORTB is not recommended while using the interrupt on change feature.

## 8.5 Resetting Timer1 using a CCP Trigger Output

### Applicable Devices

72	73	73A	74	74A	76	77
----	----	-----	----	-----	----	----

The CCP2 module is not implemented on the PIC16C72 device.

If the CCP1 or CCP2 module is configured in compare mode to generate a "special event trigger" (CCP1M3:CCP1M0 = 1011), this signal will reset Timer1.

**Note:** The special event triggers from the CCP1 and CCP2 modules will not set interrupt flag bit TMR1IF (PIR1<0>).

Timer1 must be configured for either timer or synchronized counter mode to take advantage of this feature. If Timer1 is running in asynchronous counter mode, this reset operation may not work.

In the event that a write to Timer1 coincides with a special event trigger from CCP1 or CCP2, the write will take precedence.

In this mode of operation, the CCPRxH:CCPRxL registers pair effectively becomes the period register for Timer1.

## 8.6 Resetting of Timer1 Register Pair (TMR1H, TMR1L)

### Applicable Devices

72	73	73A	74	74A	76	77
----	----	-----	----	-----	----	----

TMR1H and TMR1L registers are not reset to 00h on a POR or any other reset except by the CCP1 and CCP2 special event triggers.

T1CON register is reset to 00h on a Power-on Reset or a Brown-out Reset, which shuts off the timer and leaves a 1:1 prescale. In all other resets, the register is unaffected.

## 8.7 Timer1 Prescaler

### Applicable Devices

72	73	73A	74	74A	76	77
----	----	-----	----	-----	----	----

The prescaler counter is cleared on writes to the TMR1H or TMR1L registers.

**TABLE 8-2: REGISTERS ASSOCIATED WITH TIMER1 AS A TIMER/COUNTER**

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on: POR, BOR	Value on all other resets
0Bh,8Bh, 10Bh,18Bh	INTCON	GIE	PEIE	T0IE	INTE	RBIE	T0IF	INTF	RBIF	0000 000x	0000 000u
0Ch	PIR1	PSPIF <sup>(1,2)</sup>	ADIF	RCIF <sup>(2)</sup>	TXIF <sup>(2)</sup>	SSPIF	CCP1IF	TMR2IF	TMR1IF	0000 0000	0000 0000
8Ch	PIE1	PSPIE <sup>(1,2)</sup>	ADIE	RCIE <sup>(2)</sup>	TXIE <sup>(2)</sup>	SSPIE	CCP1IE	TMR2IE	TMR1IE	0000 0000	0000 0000
0Eh	TMR1L	Holding register for the Least Significant Byte of the 16-bit TMR1 register							xxxx xxxx	uuuu uuuu	
0Fh	TMR1H	Holding register for the Most Significant Byte of the 16-bit TMR1 register							xxxx xxxx	uuuu uuuu	
10h	T1CON	—	—	T1CKPS1	T1CKPS0	T1OSCEN	T1SYNC	TMR1CS	TMR1ON	--00 0000	--uu uuuu

Legend: x = unknown, u = unchanged, - = unimplemented read as '0'. Shaded cells are not used by the Timer1 module.

Note 1: Bits PSPIE and PSPIF are reserved on the PIC16C73/73A/76, always maintain these bits clear.

2: The PIC16C72 does not have a Parallel Slave Port or a USART, these bits are unimplemented, read as '0'.

## 11.5.2 MASTER MODE

Master mode of operation is supported in firmware using interrupt generation on the detection of the START and STOP conditions. The STOP (P) and START (S) bits are cleared from a reset or when the SSP module is disabled. The STOP (P) and START (S) bits will toggle based on the START and STOP conditions. Control of the I<sup>2</sup>C bus may be taken when the P bit is set, or the bus is idle and both the S and P bits are clear.

In master mode the SCL and SDA lines are manipulated by clearing the corresponding TRISC<4:3> bit(s). The output level is always low, irrespective of the value(s) in PORTC<4:3>. So when transmitting data, a '1' data bit must have the TRISC<4> bit set (input) and a '0' data bit must have the TRISC<4> bit cleared (output). The same scenario is true for the SCL line with the TRISC<3> bit.

The following events will cause SSP Interrupt Flag bit, SSPIF, to be set (SSP Interrupt if enabled):

- START condition
- STOP condition
- Data transfer byte transmitted/received

Master mode of operation can be done with either the slave mode idle (SSPM3:SSPM0 = 1011) or with the slave active. When both master and slave modes are enabled, the software needs to differentiate the source(s) of the interrupt.

## 11.5.3 MULTI-MASTER MODE

In multi-master mode, the interrupt generation on the detection of the START and STOP conditions allows the determination of when the bus is free. The STOP (P) and START (S) bits are cleared from a reset or when the SSP module is disabled. The STOP (P) and START (S) bits will toggle based on the START and STOP conditions. Control of the I<sup>2</sup>C bus may be taken when bit P (SSPSTAT<4>) is set, or the bus is idle and both the S and P bits clear. When the bus is busy, enabling the SSP Interrupt will generate the interrupt when the STOP condition occurs.

In multi-master operation, the SDA line must be monitored to see if the signal level is the expected output level. This check only needs to be done when a high level is output. If a high level is expected and a low level is present, the device needs to release the SDA and SCL lines (set TRISC<4:3>). There are two stages where this arbitration can be lost, these are:

- Address Transfer
- Data Transfer

When the slave logic is enabled, the slave continues to receive. If arbitration was lost during the address transfer stage, communication to the device may be in progress. If addressed an ACK pulse will be generated. If arbitration was lost during the data transfer stage, the device will need to re-transfer the data at a later time.

**TABLE 11-5: REGISTERS ASSOCIATED WITH I<sup>2</sup>C OPERATION**

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR, BOR	Value on all other resets
0Bh, 8Bh, 10Bh,18Bh	INTCON	GIE	PEIE	T0IE	INTE	RBIE	TOIF	INTF	RBIF	0000 000x	0000 000u
0Ch	PIR1	PSPIF <sup>(1)</sup>	ADIF	RCIF	TXIF	SSPIF	CCP1IF	TMR2IF	TMR1IF	0000 0000	0000 0000
8Ch	PIE1	PSPIE <sup>(1)</sup>	ADIE	RCIE	TXIE	SSPIE	CCP1IE	TMR2IE	TMR1IE	0000 0000	0000 0000
13h	SSPBUF	Synchronous Serial Port Receive Buffer/Transmit Register							xxxx xxxx	uuuu uuuu	
93h	SSPADD	Synchronous Serial Port (I <sup>2</sup> C mode) Address Register							0000 0000	0000 0000	
14h	SSPCON	WCOL	SSPOV	SSPEN	CKP	SSPM3	SSPM2	SSPM1	SSPM0	0000 0000	0000 0000
94h	SSPSTAT	SMP <sup>(2)</sup>	CKE <sup>(2)</sup>	D/A	P	S	R/W	UA	BF	0000 0000	0000 0000
87h	TRISC	PORTC Data Direction register							1111 1111	1111 1111	

Legend: x = unknown, u = unchanged, - = unimplemented locations read as '0'.  
Shaded cells are not used by SSP module in SPI mode.

Note 1: PSPIF and PSPIE are reserved on the PIC16C73/73A/76, always maintain these bits clear.

2: The SMP and CKE bits are implemented on the PIC16C76/77 only. All other PIC16C7X devices have these two bits unimplemented, read as '0'.

**FIGURE 11-27: OPERATION OF THE I<sup>2</sup>C MODULE IN IDLE\_MODE, RCV\_MODE OR XMIT\_MODE**

## 17.4 Timing Parameter Symbology

The timing parameter symbols have been created following one of the following formats:

- |                          |   |
|--------------------------|---|
| 1. TppS <sub>2</sub> ppS | 3. TCC:ST      (I <sup>2</sup> C specifications only) |
| 2. TppS                  | 4. Ts      (I <sup>2</sup> C specifications only)     |

T	
F      Frequency	T      Time

Lowercase letters (pp) and their meanings:

pp			
cc	CCP1	osc	OSC1
ck	CLKOUT	rd	$\overline{RD}$
cs	$\overline{CS}$	rw	$\overline{RD}$ or $\overline{WR}$
di	SDI	sc	SCK
do	SDO	ss	$\overline{SS}$
dt	Data in	t0	T0CKI
io	I/O port	t1	T1CKI
mc	MCLR	wr	$\overline{WR}$

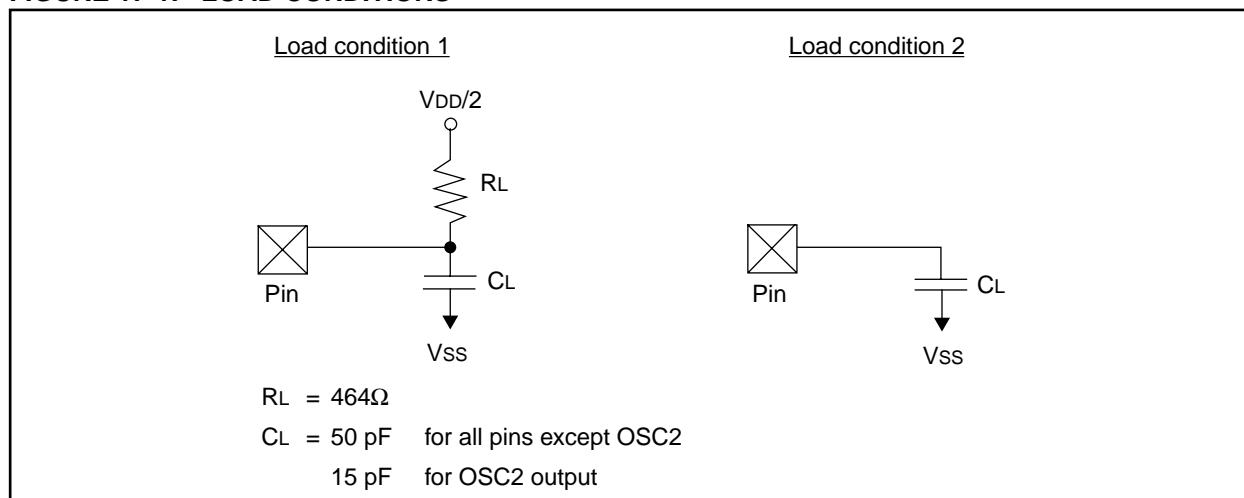

Uppercase letters and their meanings:

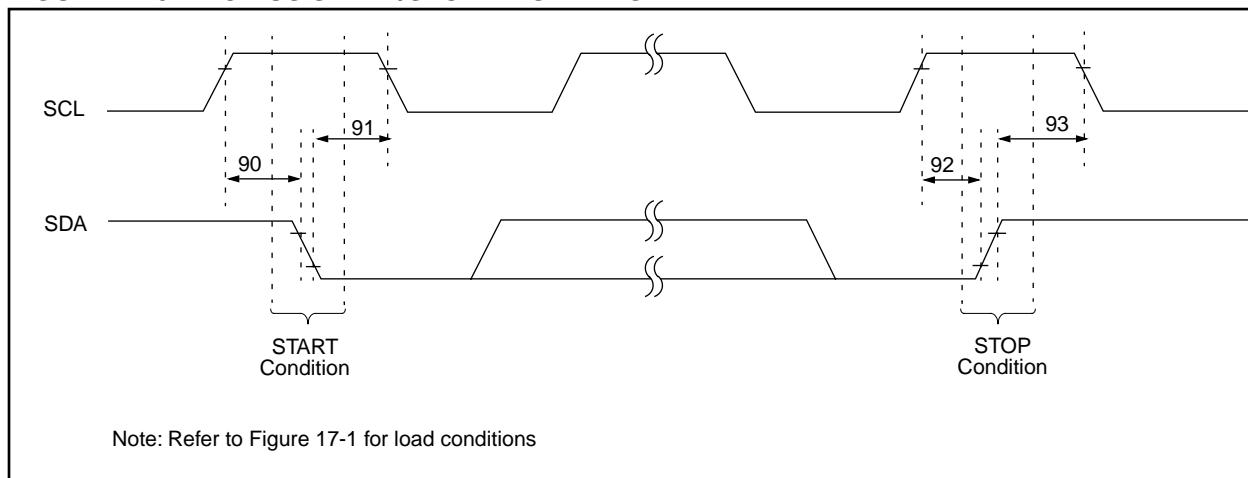

S		P	Period
F	Fall	R	Rise
H	High	V	Valid
I	Invalid (Hi-impedance)	Z	Hi-impedance
L	Low	High	High
<b>I<sup>2</sup>C only</b>		Low	Low
AA	output access		
BUF	Bus free		

Tcc:ST (I<sup>2</sup>C specifications only)

CC		SU	Setup
HD	Hold		
ST		STO	STOP condition
DAT	DATA input hold		
STA	START condition		

**FIGURE 17-1: LOAD CONDITIONS**

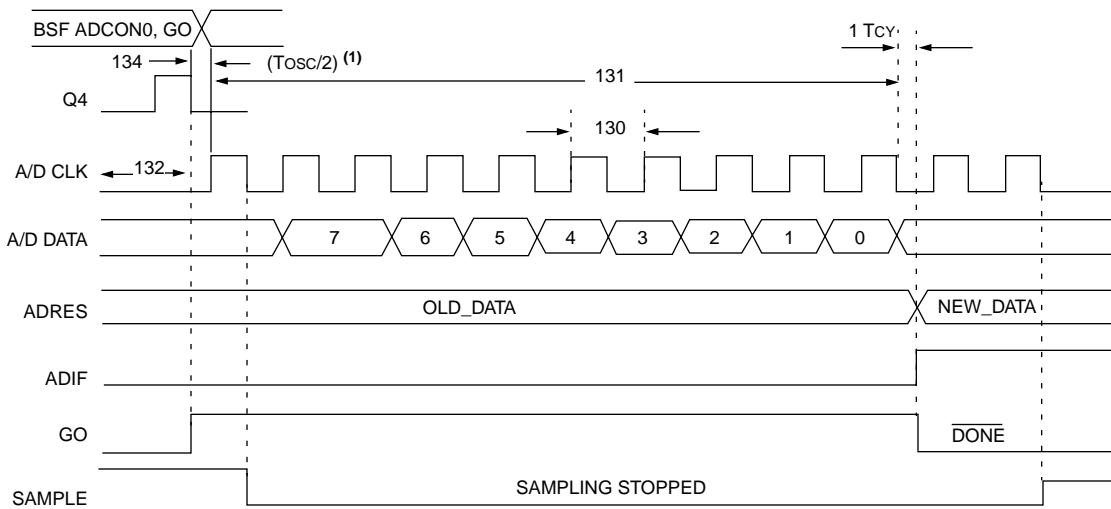

**FIGURE 17-9: I<sup>2</sup>C BUS START/STOP BITS TIMING****TABLE 17-8: I<sup>2</sup>C BUS START/STOP BITS REQUIREMENTS**

Parameter No.	Sym	Characteristic		Min	Typ	Max	Units	Conditions
90	TSU:STA	START condition	100 kHz mode	4700	—	—	ns	Only relevant for repeated START condition
		Setup time	400 kHz mode	600	—	—		
91	THD:STA	START condition	100 kHz mode	4000	—	—	ns	After this period the first clock pulse is generated
		Hold time	400 kHz mode	600	—	—		
92	TSU:STO	STOP condition	100 kHz mode	4700	—	—	ns	
		Setup time	400 kHz mode	600	—	—		
93	THD:STO	STOP condition	100 kHz mode	4000	—	—	ns	
		Hold time	400 kHz mode	600	—	—		

# PIC16C7X

**Applicable Devices** | 72 | 73 | 73A | 74 | 74A | 76 | 77 |

**FIGURE 17-11: A/D CONVERSION TIMING**

Note 1: If the A/D clock source is selected as RC, a time of  $T_{CY}$  is added before the A/D clock starts. This allows the SLEEP instruction to be executed.

**TABLE 17-11: A/D CONVERSION REQUIREMENTS**

Param No.	Sym	Characteristic		Min	Typ†	Max	Units	Conditions
130	TAD	A/D clock period	PIC16C72	1.6	—	—	μs	$T_{OSC}$ based, $V_{REF} \geq 3.0V$
			PIC16LC72	2.0	—	—	μs	$T_{OSC}$ based, $V_{REF}$ full range
			PIC16C72	2.0	4.0	6.0	μs	A/D RC Mode
			PIC16LC72	3.0	6.0	9.0	μs	A/D RC Mode
131	TCNV	Conversion time (not including S/H time) (Note 1)	—	9.5	—	—	TAD	
132	TACQ	Acquisition time	Note 2	20	—	—	μs	The minimum time is the amplifier settling time. This may be used if the "new" input voltage has not changed by more than 1 Lsb (i.e., 20.0 mV @ 5.12V) from the last sampled voltage (as stated on CHOLD).
134	TGO	Q4 to A/D clock start	—	$T_{OSC}/2$ §	—	—	—	
135	Tswc	Switching from convert → sample time	1.5 §	—	—	—	TAD	

\* These parameters are characterized but not tested.

† Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

§ This specification ensured by design.

Note 1: ADRES register may be read on the following  $T_{CY}$  cycle.

2: See Section 13.1 for min conditions.

<b>DC CHARACTERISTICS</b>		<b>Standard Operating Conditions (unless otherwise stated)</b>						
		Operating temperature		-40°C ≤ TA ≤ +125°C for extended, -40°C ≤ TA ≤ +85°C for industrial and 0°C ≤ TA ≤ +70°C for commercial				
<b>Param No.</b>	<b>Characteristic</b>	<b>Sym</b>	<b>Min</b>	<b>Typ †</b>	<b>Max</b>	<b>Units</b>	<b>Conditions</b>	
D090	<b>Output High Voltage I/O ports (Note 3)</b>	V <sub>OH</sub>	V <sub>DD</sub> - 0.7	-	-	V	I <sub>OH</sub> = -3.0 mA, V <sub>DD</sub> = 4.5V, -40°C to +85°C	
D090A			V <sub>DD</sub> - 0.7	-	-	V	I <sub>OH</sub> = -2.5 mA, V <sub>DD</sub> = 4.5V, -40°C to +125°C	
D092	<b>OSC2/CLKOUT (RC osc config)</b>		V <sub>DD</sub> - 0.7	-	-	V	I <sub>OH</sub> = -1.3 mA, V <sub>DD</sub> = 4.5V, -40°C to +85°C	
D092A			V <sub>DD</sub> - 0.7	-	-	V	I <sub>OH</sub> = -1.0 mA, V <sub>DD</sub> = 4.5V, -40°C to +125°C	
D150*	<b>Open-Drain High Voltage</b>	V <sub>OD</sub>	-	-	14	V	RA4 pin	
<b>Capacitive Loading Specs on Output Pins</b>		C <sub>osc2</sub>	-	-	15	pF	In XT, HS and LP modes when external clock is used to drive OSC1.	
D100	OSC2 pin							
D101	All I/O pins and OSC2 (in RC mode)	C <sub>IO</sub>	-	-	50	pF		
D102	SCL, SDA in I <sup>2</sup> C mode	C <sub>B</sub>	-	-	400	pF		

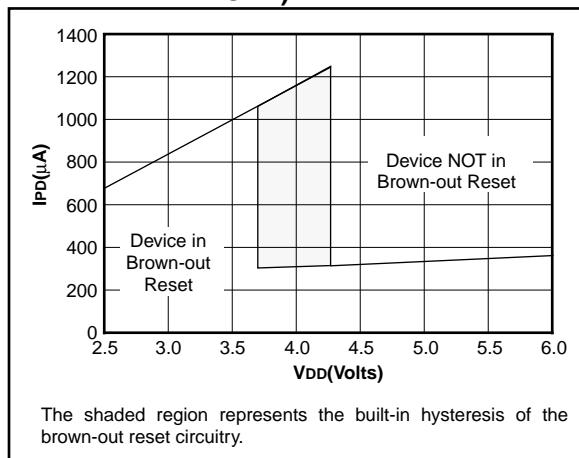

\* These parameters are characterized but not tested.

† Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

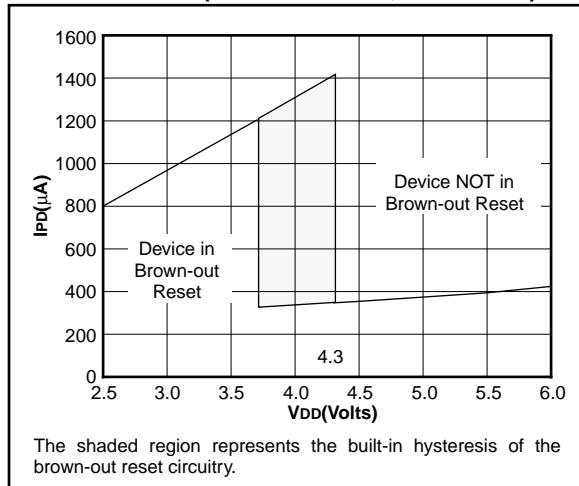

- Note 1: In RC oscillator configuration, the OSC1/CLKIN pin is a Schmitt Trigger input. It is not recommended that the PIC16C7X be driven with external clock in RC mode.
- 2: The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.
- 3: Negative current is defined as current sourced by the pin.

## APPENDIX C: WHAT'S NEW

Added the following devices:

- PIC16C76
- PIC16C77

Removed the PIC16C710, PIC16C71, PIC16C711 from this datasheet.

Added PIC16C76 and PIC16C77 devices. The PIC16C76/77 devices have 368 bytes of data memory distributed in 4 banks and 8K of program memory in 4 pages. These two devices have an enhanced SPI that supports both clock phase and polarity. The USART has been enhanced.

When upgrading to the PIC16C76/77 please note that the upper 16 bytes of data memory in banks 1,2, and 3 are mapped into bank 0. This may require relocation of data memory usage in the user application code.

Added Q-cycle definitions to the Instruction Set Summary section.

## APPENDIX D: WHAT'S CHANGED

Minor changes, spelling and grammatical changes.

Added the following note to the USART section. This note applies to all devices except the PIC16C76 and PIC16C77.

For the PIC16C73/73A/74/74A the asynchronous high speed mode (BRGH = 1) may experience a high rate of receive errors. It is recommended that BRGH = 0. If you desire a higher baud rate than BRGH = 0 can support, refer to the device errata for additional information or use the PIC16C76/77.

Divided SPI section into SPI for the PIC16C76/77 and SPI for all other devices.

## E.8 PIC16C8X Family of Devices

		PIC16F83	PIC16CR83	PIC16F84	PIC16CR84
<b>Clock</b>	Maximum Frequency of Operation (MHz)	10	10	10	10
<b>Memory</b>	Flash Program Memory	512	—	1K	—
	EEPROM Program Memory	—	—	—	—
	ROM Program Memory	—	512	—	1K
	Data Memory (bytes)	36	36	68	68
	Data EEPROM (bytes)	64	64	64	64
<b>Peripherals</b>	Timer Module(s)	TMR0	TMR0	TMR0	TMR0
<b>Features</b>	Interrupt Sources	4	4	4	4
	I/O Pins	13	13	13	13
	Voltage Range (Volts)	2.0-6.0	2.0-6.0	2.0-6.0	2.0-6.0
	Packages	18-pin DIP, SOIC	18-pin DIP, SOIC	18-pin DIP, SOIC	18-pin DIP, SOIC

All PIC16/17 Family devices have Power-on Reset, selectable Watchdog Timer, selectable code protect and high I/O current capability. All PIC16C8X Family devices use serial programming with clock pin RB6 and data pin RB7.

## E.9 PIC16C9XX Family Of Devices

		PIC16C923	PIC16C924
<b>Clock</b>	Maximum Frequency of Operation (MHz)	8	8
<b>Memory</b>	EPROM Program Memory	4K	4K
	Data Memory (bytes)	176	176
<b>Peripherals</b>	Timer Module(s)	TMR0, TMR1, TMR2	TMR0, TMR1, TMR2
	Capture/Compare/PWM Module(s)	1	1
	Serial Port(s) (SPI/I <sup>2</sup> C, USART)	SPI/I <sup>2</sup> C	SPI/I <sup>2</sup> C
	Parallel Slave Port	—	—
	A/D Converter (8-bit) Channels	—	5
	LCD Module	4 Com, 32 Seg	4 Com, 32 Seg
<b>Features</b>	Interrupt Sources	8	9
	I/O Pins	25	25
	Input Pins	27	27
	Voltage Range (Volts)	3.0-6.0	3.0-6.0
	In-Circuit Serial Programming	Yes	Yes
