Zilog - Z8F021AHJ020EC00TR Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	IrDA, UART/USART
Peripherals	Brown-out Detect/Reset, LED, LVD, POR, PWM, WDT
Number of I/O	25
Program Memory Size	2KB (2K x 8)
Program Memory Type	FLASH
EEPROM Size	64 x 8
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SSOP (0.173", 4.40mm Width)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f021ahj020ec00tr

Low-Power Operational Amplifier

The optional low-power operational amplifier (LPO) is a general-purpose amplifier primarily targeted for current sense applications. The LPO output may be routed internally to the ADC or externally to a pin.

Internal Precision Oscillator

The internal precision oscillator (IPO) is a trimmable clock source that requires no external components.

Temperature Sensor

The optional temperature sensor produces an analog output proportional to the device temperature. This signal can be sent to either the ADC or the analog comparator.

Analog Comparator

The analog comparator compares the signal at an input pin with either an internal programmable voltage reference or a second input pin. The comparator output can be used to drive either an output pin or to generate an interrupt.

External Crystal Oscillator

The crystal oscillator circuit provides highly accurate clock frequencies with the use of an external crystal, ceramic resonator or RC network.

Low Voltage Detector

The low voltage detector (LVD) is able to generate an interrupt when the supply voltage drops below a user-programmable level. The LVD is available on 8-pin devices only.

On-Chip Debugger

The Z8 Encore! XP® F082A Series products feature an integrated on-chip debugger (OCD) accessed via a single-pin interface. The OCD provides a rich-set of debugging capabilities, such as reading and writing registers, programming Flash memory, setting breakpoints, and executing code.

Signal Descriptions

Table 2 describes the Z8 Encore! XP F082A Series signals. See Pin Configurations on page 9 to determine the signals available for the specific package styles.

Table 2. Signal Descriptions

Signal Mnemonic	I/O	Description
General-Purpose I/O Ports A–D		
PA[7:0]	I/O	Port A. These pins are used for general-purpose I/O.
PB[7:0]	I/O	Port B. These pins are used for general-purpose I/O. PB6 and PB7 are available only in those devices without an ADC.
PC[7:0]	I/O	Port C. These pins are used for general-purpose I/O.
PD[0]	I/O	Port D. This pin is used for general-purpose output only.
Note: PB6 and PB7 are only available in 28-pin packages without ADC. In 28-pin packages with ADC, they are replaced by AV_{DD} and AV_{SS}.		
UART Controllers		
TXD0	O	Transmit Data. This signal is the transmit output from the UART and IrDA.
RXD0	I	Receive Data. This signal is the receive input for the UART and IrDA.
$\overline{CTS0}$	I	Clear To Send. This signal is the flow control input for the UART.
DE	O	Driver Enable. This signal allows automatic control of external RS-485 drivers. This signal is approximately the inverse of the TXE (Transmit Empty) bit in the UART Status 0 register. The DE signal may be used to ensure the external RS-485 driver is enabled when data is transmitted by the UART.
Timers		
T0OUT/T1OUT	O	Timer Output 0–1. These signals are outputs from the timers.
$\overline{T0OUT}$/$\overline{T1OUT}$	O	Timer Complement Output 0–1. These signals are output from the timers in PWM Dual Output mode.
T0IN/T1IN	I	Timer Input 0–1. These signals are used as the capture, gating and counter inputs.
Comparator		
CINP/CINN	I	Comparator Inputs. These signals are the positive and negative inputs to the comparator.
COUT	O	Comparator Output.

Table 2. Signal Descriptions (Continued)

Signal Mnemonic	I/O	Description
Analog		
ANA[7:0]	I	Analog Port. These signals are used as inputs to the analog-to-digital converter (ADC).
VREF	I/O	Analog-to-digital converter reference voltage input, or buffered output for internal reference.
Low-Power Operational Amplifier (LPO)		
AMPINP/AMPINN	I	LPO inputs. If enabled, these pins drive the positive and negative amplifier inputs respectively.
AMPOUT	O	LPO output. If enabled, this pin is driven by the on-chip LPO.
Oscillators		
XIN	I	External Crystal Input. This is the input pin to the crystal oscillator. A crystal can be connected between it and the **XOUT** pin to form the oscillator. In addition, this pin is used with external RC networks or external clock drivers to provide the system clock.
XOUT	O	External Crystal Output. This pin is the output of the crystal oscillator. A crystal can be connected between it and the **XIN** pin to form the oscillator.
Clock Input		
CLKIN	I	Clock Input Signal. This pin may be used to input a TTL-level signal to be used as the system clock.
LED Drivers		
LED	O	Direct LED drive capability. All port C pins have the capability to drive an LED without any other external components. These pins have programmable drive strengths set by the GPIO block.
On-Chip Debugger		
DBG	I/O	Debug. This signal is the control and data input and output to and from the On-Chip Debugger. **Caution:** *The DBG pin is open-drain and requires a pull-up resistor to ensure proper operation.*
Reset		
$\overline{\text{RESET}}$	I/O	RESET. Generates a Reset when asserted (driven Low). Also serves as a reset indicator; the Z8 Encore! XP forces this pin low when in reset. This pin is open-drain and features an enabled internal pull-up resistor.

PA0 and PA6 contain two different timer functions, a timer input and a complementary timer output. Both of these functions require the same GPIO configuration, the selection between the two is based on the timer mode. See Timers on page 69 for more details.

Caution: *For pin with multiple alternate functions, it is recommended to write to the AFS1 and AFS2 sub-registers before enabling the alternate function via the AF sub-register. This prevents spurious transitions through unwanted alternate function modes.*

Direct LED Drive

The Port C pins provide a current sinked output capable of driving an LED without requiring an external resistor. The output sinks current at programmable levels of 3 mA, 7 mA, 13 mA and 20 mA. This mode is enabled through the Alternate Function sub-register AFS1 and is programmable through the LED control registers. The LED Drive Enable (LEDEN) register turns on the drivers. The LED Drive Level (LEDLVLH and LEDLVLL) registers select the sink current.

For correct function, the LED anode must be connected to V_{DD} and the cathode to the GPIO pin. Using all Port C pins in LED drive mode with maximum current may result in excessive total current. See Electrical Characteristics on page 221 for the maximum total current for the applicable package.

Shared Reset Pin

On the 20- and 28-pin devices, the PD0 pin shares function with a bi-directional reset pin. Unlike all other I/O pins, this pin does not default to GPIO function on power-up. This pin acts as a bi-directional reset until the software re-configures it. The PD0 pin is output-only when in GPIO mode.

On the 8-pin product versions, the reset pin is shared with PA2, but the pin is not limited to output-only when in GPIO mode.

Caution: *If PA2 on the 8-pin product is reconfigured as an input, ensure that no external stimulus drives the pin low during any reset sequence. Since PA2 returns to its* $\overline{\text{RESET}}$ *alternate function during system resets, driving it Low holds the chip in a reset state until the pin is released.*

Shared Debug Pin

On the 8-pin version of this device only, the Debug pin shares function with the PA0 GPIO pin. This pin performs as a general purpose input pin on power-up, but the debug logic monitors this pin during the reset sequence to determine if the unlock sequence occurs. If the unlock sequence is present, the debug function is unlocked and the pin no longer func-

Table 14. Port Alternate Function Mapping (Non 8-Pin Parts)

Port	Pin	Mnemonic	Alternate Function Description	Alternate Function Set Register AFS1
Port A	PA0	T0IN/$\overline{\text{T0OUT}}$*	Timer 0 Input/Timer 0 Output Complement	N/A
		Reserved		
	PA1	T0OUT	Timer 0 Output	
		Reserved		
	PA2	DE0	UART 0 Driver Enable	
		Reserved		
	PA3	$\overline{\text{CTS0}}$	UART 0 Clear to Send	
		Reserved		
	PA4	RXD0/IRRX0	UART 0/IrDA 0 Receive Data	
		Reserved		
	PA5	TXD0/IRTX0	UART 0/IrDA 0 Transmit Data	
		Reserved		
	PA6	T1IN/$\overline{\text{T1OUT}}$*	Timer 1 Input/Timer 1 Output Complement	
		Reserved		
	PA7	T1OUT	Timer 1 Output	
		Reserved		

Note: Because there is only a single alternate function for each Port A pin, the Alternate Function Set registers are not implemented for Port A. Enabling alternate function selections as described in Port A–D Alternate Function Sub-Registers on page 47 automatically enables the associated alternate function.

* Whether PA0/PA6 take on the timer input or timer output complement function depends on the timer configuration as described in Timer Pin Signal Operation on page 82.

Table 46. Shared Interrupt Select Register (IRQSS)

BITS	7	6	5	4	3	2	1	0
FIELD	PA7VS	PA6CS	Reserved					
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	FCEH							

PA7VS—PA7/LVD Selection
0 = PA7 is used for the interrupt for PA7VS interrupt request.
1 = The LVD is used for the interrupt for PA7VS interrupt request.

PA6CS—PA6/Comparator Selection
0 = PA6 is used for the interrupt for PA6CS interrupt request.
1 = The Comparator is used for the interrupt for PA6CS interrupt request.

Reserved—Must be 0.

Interrupt Control Register

The Interrupt Control (IRQCTL) register (Table 47) contains the master enable bit for all interrupts.

Table 47. Interrupt Control Register (IRQCTL)

BITS	7	6	5	4	3	2	1	0
FIELD	IRQE	Reserved						
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R
ADDR	FCFH							

IRQE—Interrupt Request Enable
This bit is set to 1 by executing an EI (Enable Interrupts) or IRET (Interrupt Return) instruction, or by a direct register write of a 1 to this bit. It is reset to 0 by executing a DI instruction, eZ8 CPU acknowledgement of an interrupt request, Reset or by a direct register write of a 0 to this bit.
0 = Interrupts are disabled.
1 = Interrupts are enabled.

Reserved—Must be 0.

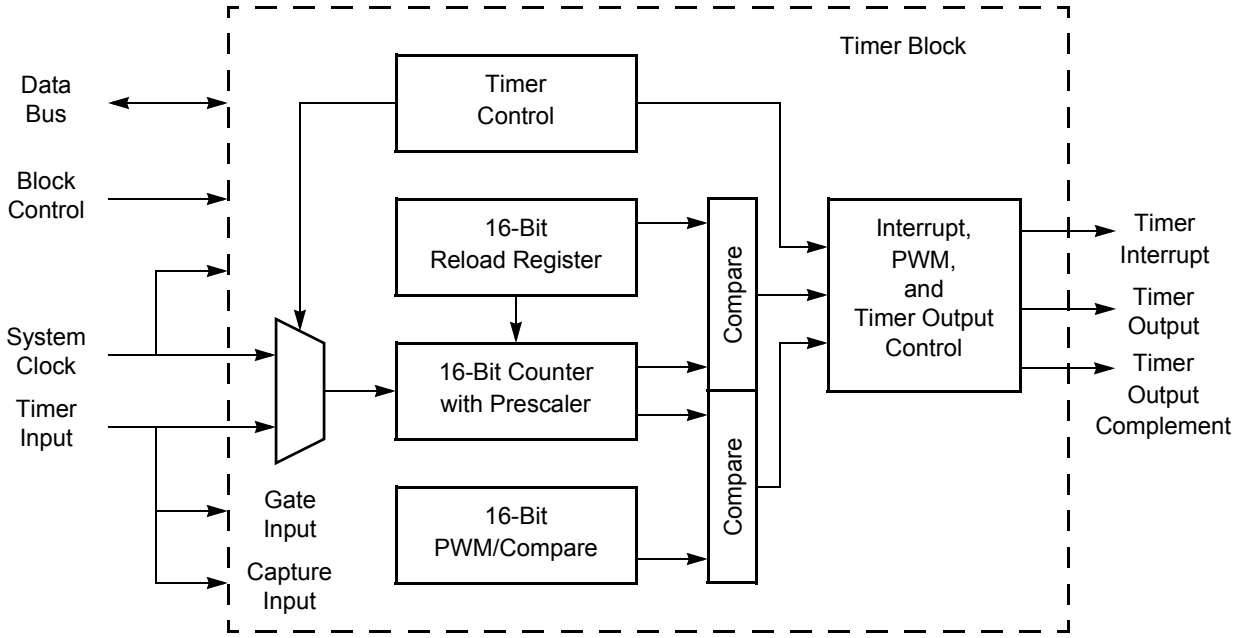

Figure 9. Timer Block Diagram

Operation

The timers are 16-bit up-counters. Minimum time-out delay is set by loading the value 0001H into the Timer Reload High and Low Byte registers and setting the prescale value to 1. Maximum time-out delay is set by loading the value 0000H into the Timer Reload High and Low Byte registers and setting the prescale value to 128. If the Timer reaches FFFFH, the timer rolls over to 0000H and continues counting.

Timer Operating Modes

The timers can be configured to operate in the following modes:

ONE-SHOT Mode

In ONE-SHOT mode, the timer counts up to the 16-bit Reload value stored in the Timer Reload High and Low byte registers. The timer input is the system clock. Upon reaching the Reload value, the timer generates an interrupt and the count value in the Timer High and Low Byte registers is reset to 0001H. The timer is automatically disabled and stops counting.

1 = Received data does not generate an interrupt request to the Interrupt Controller. Only receiver errors generate an interrupt request.

IREN—Infrared Encoder/Decoder Enable
0 = Infrared Encoder/Decoder is disabled. UART operates normally.
1 = Infrared Encoder/Decoder is enabled. The UART transmits and receives data through the Infrared Encoder/Decoder.

UART Status 0 Register

The UART Status 0 (UxSTAT0) and Status 1(UxSTAT1) registers (Table 63 and Table 64) identify the current UART operating configuration and status.

Table 63. UART Status 0 Register (U0STAT0)

BITS	7	6	5	4	3	2	1	0
FIELD	RDA	PE	OE	FE	BRKD	TDRE	TXE	CTS
RESET	0	0	0	0	0	1	1	X
R/W	R	R	R	R	R	R	R	R
ADDR	F41H							

RDA—Receive Data Available
This bit indicates that the UART Receive Data register has received data. Reading the UART Receive Data register clears this bit.
0 = The UART Receive Data register is empty.
1 = There is a byte in the UART Receive Data register.

PE—Parity Error
This bit indicates that a parity error has occurred. Reading the UART Receive Data register clears this bit.

0 = No parity error has occurred.
1 = A parity error has occurred.

OE—Overrun Error
This bit indicates that an overrun error has occurred. An overrun occurs when new data is received and the UART Receive Data register has not been read. If the RDA bit is reset to 0, reading the UART Receive Data register clears this bit.
0 = No overrun error occurred.
1 = An overrun error occurred.

FE—Framing Error
This bit indicates that a framing error (no Stop bit following data reception) was detected. Reading the UART Receive Data register clears this bit.

Table 70. UART Baud Rates (Continued)

3.579545 MHz System Clock				1.8432 MHz System Clock			
Acceptable Rate (kHz)	BRG Divisor (Decimal)	Actual Rate (kHz)	Error (%)	Acceptable Rate (kHz)	BRG Divisor (Decimal)	Actual Rate (kHz)	Error (%)

0.30	746	0.30	-0.04	0.30	384	0.30	0.00

Receiving IrDA Data

Data received from the infrared transceiver using the IR_RXD signal through the RXD pin is decoded by the Infrared Endec and passed to the UART. The UART's baud rate clock is used by the Infrared Endec to generate the demodulated signal (RXD) that drives the UART. Each UART/Infrared data bit is 16-clocks wide. Figure 18 displays data reception. When the Infrared Endec is enabled, the UART's RXD signal is internal to the Z8 Encore! XP® F082A Series products while the IR_RXD signal is received through the RXD pin.

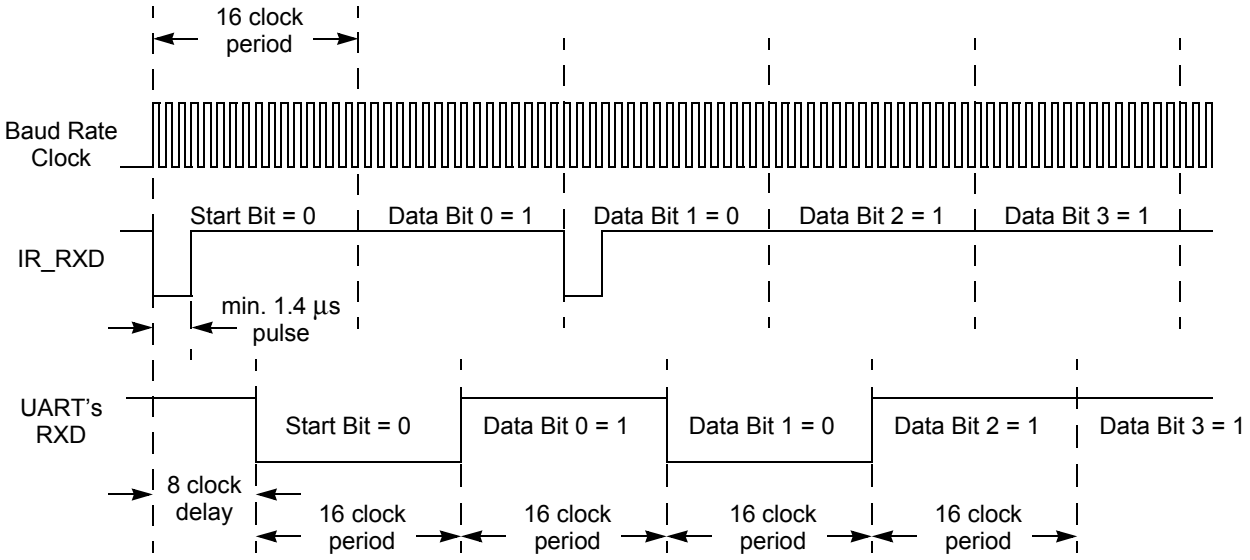

Figure 18. IrDA Data Reception

Infrared Data Reception

Caution: *The system clock frequency must be at least 1.0 MHz to ensure proper reception of the 1.4 µs minimum width pulses allowed by the IrDA standard.*

Endec Receiver Synchronization

The IrDA receiver uses a local baud rate clock counter (0 to 15 clock periods) to generate an input stream for the UART and to create a sampling window for detection of incoming pulses. The generated UART input (UART RXD) is delayed by 8 baud rate clock periods with respect to the incoming IrDA data stream. When a falling edge in the input data stream is detected, the Endec counter is reset. When the count reaches a value of 8, the UART RXD value is updated to reflect the value of the decoded data. When the count reaches 12 baud clock periods, the sampling window for the next incoming pulse opens. The window remains open until the count again reaches 8 (that is, 24 baud clock periods since the previous pulse was detected), giving the Endec a sampling window of minus four

Compensation Steps:

1. Correct for Offset

ADC MSB	ADC LSB

-

Offset MSB	Offset LSB

=

#1 MSB	#1 LSB

2. Take absolute value of the offset corrected ADC value *if negative*—the gain correction factor is computed assuming positive numbers, with sign restoration afterward.

#2 MSB	#2 LSB

Also take absolute value of the gain correction word *if negative*.

AGain MSB	AGain LSB

3. Multiply by Gain Correction Word. If in DIFFERENTIAL mode, there are two gain correction values: one for positive ADC values, another for negative ADC values. Based on the sign of #2, use the appropriate Gain Correction Word.

#2 MSB	#2 LSB

*

AGain MSB	AGain LSB

=

#3	#3	#3	#3

4. Round the result and discard the least significant two bytes (this is equivalent to dividing by 2^{16}).

#3	#3	#3	#3

-

0x00	0x00	0x80	0x00

=

#4 MSB	#4 LSB

5. Determine sign of the gain correction factor using the sign bits from Step 2. If the offset corrected ADC value AND the gain correction word have the same sign, then the factor is positive and is left unchanged. If they have differing signs, then the factor is negative and must be multiplied by -1.

Comparator

The Z8 Encore! XP® F082A Series devices feature a general purpose comparator that compares two analog input signals. These analog signals may be external stimulus from a pin (CINP and/or CINN) or internally generated signals. Both a programmable voltage reference and the temperature sensor output voltage are available internally. The output is available as an interrupt source or can be routed to an external pin.

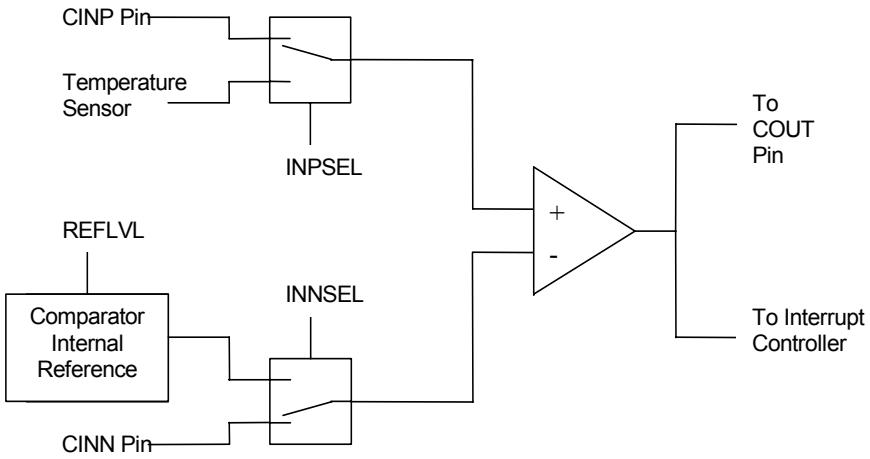

Figure 20. Comparator Block Diagram

Operation

When the positive comparator input exceeds the negative input by more than the specified hysteresis, the output is a logic HIGH. When the negative input exceeds the positive by more than the hysteresis, the output is a logic LOW. Otherwise, the comparator output retains its present value. See Table 137 on page 233 for details.

The comparator may be powered down to reduce supply current. See Power Control Register 0 on page 34 for details.

Caution: *Because of the propagation delay of the comparator, it is not recommended to enable or reconfigure the comparator without first disabling interrupts and waiting for the comparator output to settle. Doing so can result in spurious interrupts. The following example describes how to safely enable the comparator:*

```
di
ld cmp0, r0 ; load some new configuration
nop
```

```
nop      ; wait for output to settle
clr irq0 ; clear any spurious interrupts pending
ei
```

Comparator Control Register Definitions

Comparator Control Register

The Comparator Control Register (CMP0) configures the comparator inputs and sets the value of the internal voltage reference.

Table 75. Comparator Control Register (CMP0)

BITS	7	6	5	4	3	2	1	0
FIELD	INPSEL	INNSEL	REFLVL				Reserved (20-/28-pin) REFLVL (8-pin)	
RESET	0	0	0	1	0	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	F90H							

INPSEL—Signal Select for Positive Input
0 = GPIO pin used as positive comparator input
1 = temperature sensor used as positive comparator input

INNSEL—Signal Select for Negative Input
0 = internal reference disabled, GPIO pin used as negative comparator input
1 = internal reference enabled as negative comparator input

REFLVL—Internal Reference Voltage Level (this reference is independent of the ADC voltage reference). Note that the 8-pin devices contain two additional LSBs for increased resolution.

For 20-/28-pin devices:

0000 = 0.0 V
0001 = 0.2 V
0010 = 0.4 V
0011 = 0.6 V
0100 = 0.8 V
0101 = 1.0 V (Default)
0110 = 1.2 V
0111 = 1.4 V
1000 = 1.6 V

Trim Bit Data Register

The Trim Bid Data (TRMDR) register contains the read or write data for access to the trim option bits (Table 85).

Table 85. Trim Bit Data Register (TRMDR)

BITS	7	6	5	4	3	2	1	0
FIELD	TRMDR - Trim Bit Data							
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	FF7H							

Flash Option Bit Address Space

The first two bytes of Flash program memory at addresses 0000H and 0001H are reserved for the user-programmable Flash option bits.

Flash Program Memory Address 0000H

Table 86. Flash Option Bits at Program Memory Address 0000H

BITS	7	6	5	4	3	2	1	0
FIELD	WDT_RES	WDT_AO	OSC_SEL[1:0]		VBO_AO	FRP	Reserved	FWP
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	Program Memory 0000H							

Note: U = Unchanged by Reset. R/W = Read/Write.

WDT_RES—Watchdog Timer Reset
0 = Watchdog Timer time-out generates an interrupt request. Interrupts must be globally enabled for the eZ8 CPU to acknowledge the interrupt request.
1 = Watchdog Timer time-out causes a system reset. This setting is the default for unprogrammed (erased) Flash.

WDT_AO—Watchdog Timer Always On
0 = Watchdog Timer is automatically enabled upon application of system power. Watchdog Timer can not be disabled.

DBGACK—Debug Acknowledge
This bit enables the debug acknowledge feature. If this bit is set to 1, the OCD sends a Debug Acknowledge character (FFH) to the host when a Breakpoint occurs.
0 = Debug Acknowledge is disabled.
1 = Debug Acknowledge is enabled.

Reserved—Must be 0.

RST—Reset
Setting this bit to 1 resets the Z8F04xA family device. The device goes through a normal Power-On Reset sequence with the exception that the On-Chip Debugger is not reset. This bit is automatically cleared to 0 at the end of reset.
0 = No effect.
1 = Reset the Flash Read Protect Option Bit device.

OCD Status Register

The OCD Status register reports status information about the current state of the debugger and the system.

Table 107. OCD Status Register (OCDSTAT)

BITS	7	6	5	4	3	2	1	0
FIELD	DBG	HALT	FRPENB	Reserved				
RESET	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

DBG—Debug Status
0 = NORMAL mode
1 = DEBUG mode

HALT—HALT Mode
0 = Not in HALT mode
1 = In HALT mode

FRPENB—Flash Read Protect Option Bit Enable
0 = FRP bit enabled, that allows disabling of many OCD commands
1 = FRP bit has no effect

Reserved—Must be 0

Table 125. Opcode Map Abbreviations

Abbreviation	Description	Abbreviation	Description
b	Bit position	IRR	Indirect Register Pair
