
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	IrDA, UART/USART
Peripherals	Brown-out Detect/Reset, LED, LVD, POR, PWM, WDT
Number of I/O	25
Program Memory Size	4KB (4K x 8)
Program Memory Type	FLASH
EEPROM Size	128 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.600", 15.24mm)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f041apj020sc

Pin Description

The Z8 Encore! XP® F082A Series products are available in a variety of packages styles and pin configurations. This chapter describes the signals and available pin configurations for each of the package styles. For information on physical package specifications, see Packaging on page 241.

Available Packages

The following package styles are available for each device in the Z8 Encore! XP F082A Series product line:

- SOIC
  - 8-, 20-, and 28-pin
- PDIP
  - 8-, 20-, and 28-pin
- SSOP
  - 20- and 28- pin
- QFN (this is an MLF-S, a QFN style package with an 8-pin SOIC footprint)
  - 8-pin

In addition, the Z8 Encore! XP F082A Series devices are available both with and without advanced analog capability (ADC, temperature sensor and op amp). Devices Z8F082A, Z8F042A, Z8F022A, and Z8F012A contain the advanced analog, while devices Z8F081A, Z8F041A, Z8F021A, and Z8F011A do not have the advanced analog capability.

Pin Configurations

Figure 2 through Figure 4 display the pin configurations for all the packages available in the Z8 Encore! XP F082A Series. See Table 2 on page 11 for a description of the signals. The analog input alternate functions (ANA*x*) are not available on the Z8F081A, Z8F041A, Z8F021A, and Z8F011A devices. The analog supply pins (AV_{DD} and AV_{SS}) are also not available on these parts, and are replaced by PB6 and PB7.

At reset, all Port A, B and C pins default to an input state. In addition, any alternate functionality is not enabled, so the pins function as general purpose input ports until programmed otherwise. At powerup, the PD0 pin defaults to the $\overline{\text{RESET}}$ alternate function.

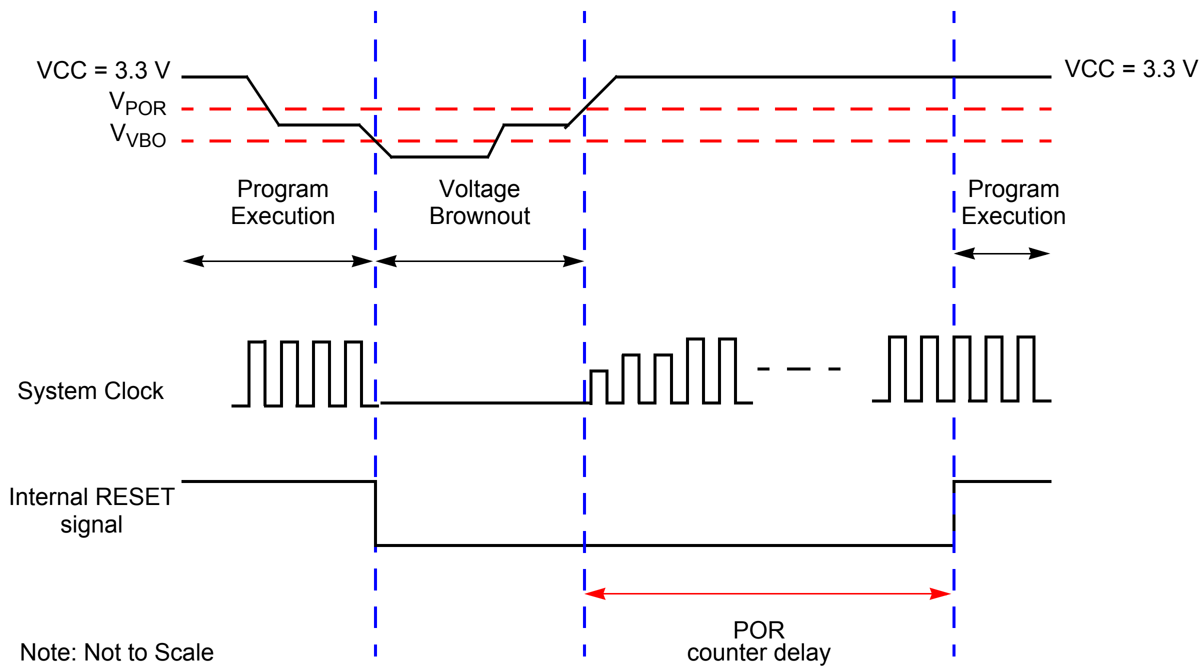

Figure 6. Voltage Brownout Reset Operation

The POR level is greater than the VBO level by the specified hysteresis value. This ensures that the device undergoes a Power-On Reset after recovering from a VBO condition.

Watchdog Timer Reset

If the device is in NORMAL or HALT mode, the Watchdog Timer can initiate a System Reset at time-out if the WDT_RES Flash Option Bit is programmed to 1. This is the unprogrammed state of the WDT_RES Flash Option Bit. If the bit is programmed to 0, it configures the Watchdog Timer to cause an interrupt, not a System Reset, at time-out.

The WDT bit in the Reset Status (RSTSTAT) register is set to signify that the reset was initiated by the Watchdog Timer.

External Reset Input

The $\overline{\text{RESET}}$ pin has a Schmitt-Triggered input and an internal pull-up resistor. Once the $\overline{\text{RESET}}$ pin is asserted for a minimum of four system clock cycles, the device progresses through the System Reset sequence. Because of the possible asynchronicity of the system clock and reset signals, the required reset duration may be as short as three clock periods

Caution: *The following coding style that clears bits in the Interrupt Request registers is not recommended. All incoming interrupts received between execution of the first* `LDX` *command and the final LDX command are lost.*

Poor coding style that can result in lost interrupt requests:

```
LDX r0, IRQ0
AND r0, MASK
LDX IRQ0, r0
```

Caution: *To avoid missing interrupts, use the following coding style to clear bits in the Interrupt Request 0 register:*

Good coding style that avoids lost interrupt requests:

```
ANDX IRQ0, MASK
```

Software Interrupt Assertion

Program code can generate interrupts directly. Writing a 1 to the correct bit in the Interrupt Request register triggers an interrupt (assuming that interrupt is enabled). When the interrupt request is acknowledged by the eZ8 CPU, the bit in the Interrupt Request register is automatically cleared to 0.

Caution: *The following coding style used to generate software interrupts by setting bits in the Interrupt Request registers is not recommended. All incoming interrupts received between execution of the first LDX command and the final LDX command are lost.*

Poor coding style that can result in lost interrupt requests:

```
LDX r0, IRQ0
OR r0, MASK
LDX IRQ0, r0
```

Caution: *To avoid missing interrupts, use the following coding style to set bits in the Interrupt Request registers:*

Good coding style that avoids lost interrupt requests:

```
ORX IRQ0, MASK
```

Watchdog Timer Interrupt Assertion

The Watchdog Timer interrupt behavior is different from interrupts generated by other sources. The Watchdog Timer continues to assert an interrupt as long as the timeout condition continues. As it operates on a different (and usually slower) clock domain than the rest of the device, the Watchdog Timer continues to assert this interrupt for many system clocks until the counter rolls over.

Follow the steps below for configuring a timer for CAPTURE mode and initiating the count:

1. Write to the Timer Control register to:
   - Disable the timer.
   - Configure the timer for CAPTURE mode.
   - Set the prescale value.
   - Set the Capture edge (rising or falling) for the Timer Input.
2. Write to the Timer High and Low Byte registers to set the starting count value (typically `0001H`).
3. Write to the Timer Reload High and Low Byte registers to set the Reload value.
4. Clear the Timer PWM High and Low Byte registers to `0000H`. Clearing these registers allows the software to determine if interrupts were generated by either a capture event or a reload. If the PWM High and Low Byte registers still contain `0000H` after the interrupt, the interrupt was generated by a Reload.
5. Enable the timer interrupt, if appropriate, and set the timer interrupt priority by writing to the relevant interrupt registers. By default, the timer interrupt is generated for both input capture and reload events. If appropriate, configure the timer interrupt to be generated only at the input capture event or the reload event by setting TICONFIG field of the TxCTL0 register.
6. Configure the associated GPIO port pin for the Timer Input alternate function.
7. Write to the Timer Control register to enable the timer and initiate counting.

In CAPTURE mode, the elapsed time from timer start to Capture event can be calculated using the following equation:

$$\text{Capture Elapsed Time (s)} = \frac{(\text{Capture Value} - \text{Start Value}) \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

CAPTURE RESTART Mode

In CAPTURE RESTART mode, the current timer count value is recorded when the acceptable external Timer Input transition occurs. The Capture count value is written to the Timer PWM High and Low Byte Registers. The timer input is the system clock. The `TPOL` bit in the Timer Control register determines if the Capture occurs on a rising edge or a falling edge of the Timer Input signal. When the Capture event occurs, an interrupt is generated and the count value in the Timer High and Low Byte registers is reset to `0001H` and counting resumes. The INPCAP bit in TxCTL0 register is set to indicate the timer interrupt is because of an input capture event.

If no Capture event occurs, the timer counts up to the 16-bit Compare value stored in the Timer Reload High and Low Byte registers. Upon reaching the Reload value, the timer generates an interrupt, the count value in the Timer High and Low Byte registers is reset to

Watchdog Timer

The Watchdog Timer (WDT) protects against corrupt or unreliable software, power faults, and other system-level problems which may place the Z8 Encore! XP® F082A Series devices into unsuitable operating states. The features of Watchdog Timer include:

- On-chip RC oscillator.
- A selectable time-out response: reset or interrupt.
- 24-bit programmable time-out value.

Operation

The Watchdog Timer is a one-shot timer that resets or interrupts the Z8 Encore! XP F082A Series devices when the WDT reaches its terminal count. The Watchdog Timer uses a dedicated on-chip RC oscillator as its clock source. The Watchdog Timer operates in only two modes: ON and OFF. Once enabled, it always counts and must be refreshed to prevent a time-out. Perform an enable by executing the WDT instruction or by setting the WDT_AO Flash Option Bit. The WDT_AO bit forces the Watchdog Timer to operate immediately upon reset, even if a WDT instruction has not been executed.

The Watchdog Timer is a 24-bit reloadable downcounter that uses three 8-bit registers in the eZ8 CPU register space to set the reload value. The nominal WDT time-out period is described by the following equation:

$$\text{WDT Time-out Period (ms)} = \frac{\text{WDT Reload Value}}{10}$$

where the WDT reload value is the decimal value of the 24-bit value given by {WDTU[7:0], WDTH[7:0], WDTL[7:0]} and the typical Watchdog Timer RC oscillator frequency is 10 kHz. The Watchdog Timer cannot be refreshed after it reaches `000002H`. The WDT Reload Value must not be set to values below `000004H`. Table 56 provides information about approximate time-out delays for the minimum and maximum WDT reload values.

Table 56. Watchdog Timer Approximate Time-Out Delays

WDT Reload Value (Hex)	WDT Reload Value (Decimal)	Approximate Time-Out Delay (with 10 kHz typical WDT oscillator frequency)	
		Typical	Description
000004	4	400 μs	Minimum time-out delay
FFFFFF	16,777,215	28 minutes	Maximum time-out delay

Watchdog Timer Reload Registers results in a one-second timeout at room temperature and 3.3 V supply voltage.

Timeouts other than one second may be obtained by scaling the calibration values up or down as required.

Note: *The Watchdog Timer accuracy still degrades as temperature and supply voltage vary. See* Table 133 on page 230 *for* details.

Watchdog Timer Control Register Definitions

Watchdog Timer Control Register

The Watchdog Timer Control (WDTCTL) register is a write-only control register. Writing the `55H`, `AAH` unlock sequence to the WDTCTL register address unlocks the three Watchdog Timer Reload Byte registers (WDTU, WDTH, and WDTL) to allow changes to the time-out period. These write operations to the WDTCTL register address produce no effect on the bits in the WDTCTL register. The locking mechanism prevents spurious writes to the Reload registers.

This register address is shared with the read-only Reset Status register.

Table 57. Watchdog Timer Control Register (WDTCTL)

BITS	7	6	5	4	3	2	1	0
FIELD	WDTUNLK							
RESET	X	X	X	X	X	X	X	X
R/W	W	W	W	W	W	W	W	W
ADDR	FF0H							
X = Undefined.								

WDTUNLK—Watchdog Timer Unlock
The software must write the correct unlocking sequence to this register before it is allowed to modify the contents of the Watchdog Timer reload registers.

Watchdog Timer Reload Upper, High and Low Byte Registers

The Watchdog Timer Reload Upper, High and Low Byte (WDTU, WDTH, WDTL) registers (Table 58 through Table 60) form the 24-bit reload value that is loaded into the Watchdog Timer when a WDT instruction executes. The 24-bit reload value is {WDTU[7:0], WDTH[7:0], WDTL[7:0]}. Writing to these registers sets the appropriate Reload Value. Reading from these registers returns the current Watchdog Timer count value.

Caution: *The 24-bit WDT Reload Value must not be set to a value less than* `000004H`.

Table 58. Watchdog Timer Reload Upper Byte Register (WDTU)

BITS	7	6	5	4	3	2	1	0
FIELD	WDTU							
RESET	00H							
R/W	R/W*							
ADDR	FF1H							
R/W* - Read returns the current WDT count value. Write sets the appropriate Reload Value.								

WDTU—WDT Reload Upper Byte
Most-significant byte (MSB), Bits[23:16], of the 24-bit WDT reload value.

Table 59. Watchdog Timer Reload High Byte Register (WDTH)

BITS	7	6	5	4	3	2	1	0
FIELD	WDTH							
RESET	04H							
R/W	R/W*							
ADDR	FF2H							
R/W* - Read returns the current WDT count value. Write sets the appropriate Reload Value.								

WDTH—WDT Reload High Byte
Middle byte, Bits[15:8], of the 24-bit WDT reload value.

Table 60. Watchdog Timer Reload Low Byte Register (WDTL)

BITS	7	6	5	4	3	2	1	0
FIELD	WDTL							
RESET	00H							
R/W	R/W*							
ADDR	FF3H							
R/W* - Read returns the current WDT count value. Write sets the appropriate Reload Value.								

WDTL—WDT Reload Low

Least significant byte (LSB), Bits[7:0], of the 24-bit WDT reload value.

Universal Asynchronous Receiver/Transmitter

The universal asynchronous receiver/transmitter (UART) is a full-duplex communication channel capable of handling asynchronous data transfers. The UART uses a single 8-bit data mode with selectable parity. Features of the UART include:

- 8-bit asynchronous data transfer.
- Selectable even- and odd-parity generation and checking.
- Option of one or two STOP bits.
- Separate transmit and receive interrupts.
- Framing, parity, overrun and break detection.
- Separate transmit and receive enables.
- 16-bit baud rate generator (BRG).
- Selectable MULTIPROCESSOR (9-bit) mode with three configurable interrupt schemes.
- Baud rate generator (BRG) can be configured and used as a basic 16-bit timer.
- Driver enable (DE) output for external bus transceivers.

Architecture

The UART consists of three primary functional blocks: transmitter, receiver, and baud rate generator. The UART's transmitter and receiver function independently, but employ the same baud rate and data format. Figure 10 on page 98 displays the UART architecture.

value `63H` to the Flash Control register initiates the Mass Erase operation. While the Flash Controller executes the Mass Erase operation, the eZ8 CPU idles but the system clock and on-chip peripherals continue to operate. Using the On-Chip Debugger, poll the Flash Status register to determine when the Mass Erase operation is complete. When the Mass Erase is complete, the Flash Controller returns to its locked state.

Flash Controller Bypass

The Flash Controller can be bypassed and the control signals for the Flash memory brought out to the GPIO pins. Bypassing the Flash Controller allows faster Row Programming algorithms by controlling the Flash programming signals directly.

Row programming is recommended for gang programming applications and large volume customers who do not require in-circuit initial programming of the Flash memory. Page Erase operations are also supported when the Flash Controller is bypassed.

For more information on bypassing the Flash Controller, refer to *Third-Party Flash Programming Support for Z8 Encore!® MCU Application Note (AN0117)* available for download at www.zilog.com.

Flash Controller Behavior in DEBUG Mode

The following changes in behavior of the Flash Controller occur when the Flash Controller is accessed using the On-Chip Debugger:

- The Flash Write Protect option bit is ignored.
- The Flash Sector Protect register is ignored for programming and erase operations.
- Programming operations are not limited to the page selected in the Page Select register.
- Bits in the Flash Sector Protect register can be written to one or zero.
- The second write of the Page Select register to unlock the Flash Controller is not necessary.
- The Page Select register can be written when the Flash Controller is unlocked.
- The Mass Erase command is enabled through the Flash Control register.

Caution: *For security reasons, the Flash controller allows only a single page to be opened for write/erase. When writing multiple Flash pages, the flash controller must go through the unlock sequence again to select another page.*

WDTCALH—Watchdog Timer Calibration High Byte
The WDTCALH and WDTCALL bytes, when loaded into the Watchdog Timer reload registers result in a one second timeout at room temperature and 3.3 V supply voltage. To use the Watchdog Timer calibration, user code must load WDTU with 0x00, WDTH with WDTCALH and WDTL with WDTCALL.

Table 98. Watchdog Calibration Low Byte at 007FH (WDTCALL)

BITS	7	6	5	4	3	2	1	0
FIELD	WDTCALL							
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	Information Page Memory 007FH							
Note: U = Unchanged by Reset. R/W = Read/Write.								

WDTCALL—Watchdog Timer Calibration Low Byte
The WDTCALH and WDTCALL bytes, when loaded into the Watchdog Timer reload registers result in a one second timeout at room temperature and 3.3 V supply voltage. To use the Watchdog Timer calibration, user code must load WDTU with 0x00, WDTH with WDTCALH and WDTL with WDTCALL.

Serialization Data

Table 99. Serial Number at 001C - 001F (S_NUM)

BITS	7	6	5	4	3	2	1	0
FIELD	S_NUM							
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	Information Page Memory 001C-001F							
Note: U = Unchanged by Reset. R/W = Read/Write.								

S_NUM—Serial Number Byte
The serial number is a unique four-byte binary value.

Write Memory, Read Memory, Write Register, Read Register, Read Memory CRC, Step Instruction, Stuff Instruction, and Execute Instruction commands.

```
DBG ← 03H
DBG → RuntimeCounter[15:8]
DBG → RuntimeCounter[7:0]
```

- **Write OCD Control Register (04H)**—The Write OCD Control Register command writes the data that follows to the OCDCTL register. When the Flash Read Protect Option Bit is enabled, the DBGMODE bit (OCDCTL[7]) can only be set to 1, it cannot be cleared to 0 and the only method of returning the device to normal operating mode is to reset the device.

```
DBG ← 04H
DBG ← OCDCTL[7:0]
```

- **Read OCD Control Register (05H)**—The Read OCD Control Register command reads the value of the OCDCTL register.

```
DBG ← 05H
DBG → OCDCTL[7:0]
```

- **Write Program Counter (06H)**—The Write Program Counter command writes the data that follows to the eZ8 CPU's Program Counter (PC). If the device is not in DEBUG mode or if the Flash Read Protect Option bit is enabled, the Program Counter (PC) values are discarded.

```
DBG ← 06H
DBG ← ProgramCounter[15:8]
DBG ← ProgramCounter[7:0]
```

- **Read Program Counter (07H)**—The Read Program Counter command reads the value in the eZ8 CPU's Program Counter (PC). If the device is not in DEBUG mode or if the Flash Read Protect Option bit is enabled, this command returns FFFFH.

```
DBG ← 07H
DBG → ProgramCounter[15:8]
DBG → ProgramCounter[7:0]
```

- **Write Register (08H)**—The Write Register command writes data to the Register File. Data can be written 1–256 bytes at a time (256 bytes can be written by setting size to 0). If the device is not in DEBUG mode, the address and data values are discarded. If the Flash Read Protect Option bit is enabled, only writes to the Flash Control Registers are allowed and all other register write data values are discarded.

```
DBG ← 08H
DBG ← {4'h0,Register Address[11:8]}
DBG ← Register Address[7:0]
DBG ← Size[7:0]
DBG ← 1-256 data bytes
```

Table 114. Notational Shorthand

Notation	Description	Operand	Range
b	Bit	b	b represents a value from 0 to 7 (000B to 111B).
cc	Condition Code	—	Refer to Condition Codes section in the *eZ8 CPU Core User Manual (UM0128)*.
DA	Direct Address	Addrs	Addrs. represents a number in the range of 0000H to FFFFH
ER	Extended Addressing Register	Reg	Reg. represents a number in the range of 000H to FFFH
IM	Immediate Data	#Data	Data is a number between 00H to FFH
Ir	Indirect Working Register	@Rn	n = 0–15
IR	Indirect Register	@Reg	Reg. represents a number in the range of 00H to FFH
Irr	Indirect Working Register Pair	@RRp	p = 0, 2, 4, 6, 8, 10, 12, or 14
IRR	Indirect Register Pair	@Reg	Reg. represents an even number in the range 00H to FEH
p	Polarity	p	Polarity is a single bit binary value of either 0B or 1B.
r	Working Register	Rn	n = 0 – 15
R	Register	Reg	Reg. represents a number in the range of 00H to FFH
RA	Relative Address	X	X represents an index in the range of +127 to –128 which is an offset relative to the address of the next instruction
rr	Working Register Pair	RRp	p = 0, 2, 4, 6, 8, 10, 12, or 14
RR	Register Pair	Reg	Reg. represents an even number in the range of 00H to FEH
Vector	Vector Address	Vector	Vector represents a number in the range of 00H to FFH
X	Indexed	#Index	The register or register pair to be indexed is offset by the signed Index value (#Index) in a +127 to -128 range.

Table 115 lists additional symbols that are used throughout the Instruction Summary and Instruction Set Description sections.

Table 123. Rotate and Shift Instructions (Continued)

Mnemonic	Operands	Instruction
SRA	dst	Shift Right Arithmetic
SRL	dst	Shift Right Logical
SWAP	dst	Swap Nibbles

eZ8 CPU Instruction Summary

Table 124 summarizes the eZ8 CPU instructions. The table identifies the addressing modes employed by the instruction, the effect upon the Flags register, the number of CPU clock cycles required for the instruction fetch, and the number of CPU clock cycles required for the instruction execution.

Table 124. eZ8 CPU Instruction Summary

Assembly Mnemonic	Symbolic Operation	Address Mode		Opcode(s) (Hex)	Flags						Fetch Cycles	Instr. Cycles

Electrical Characteristics

The data in this chapter is pre-qualification and pre-characterization and is subject to change. Additional electrical characteristics may be found in the individual chapters.

Absolute Maximum Ratings

Stresses greater than those listed in Table 126 may cause permanent damage to the device. These ratings are stress ratings only. Operation of the device at any condition outside those indicated in the operational sections of these specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. For improved reliability, tie unused inputs to one of the supply voltages (V_{DD} or V_{SS}).

Table 126. Absolute Maximum Ratings

Parameter	Minimum	Maximum	Units	Notes
Ambient temperature under bias	-40	+105	°C	
Storage temperature	-65	+150	°C	
Voltage on any pin with respect to V_{SS}	-0.3	+5.5	V	1
	-0.3	+3.9	V	2
Voltage on V_{DD} pin with respect to V_{SS}	-0.3	+3.6	V	
Maximum current on input and/or inactive output pin	-5	+5	µA	
Maximum output current from active output pin	-25	+25	mA	
8-pin Packages Maximum Ratings at 0 °C to 70 °C				
Total power dissipation		220	mW	
Maximum current into V_{DD} or out of V_{SS}		60	mA	
20-pin Packages Maximum Ratings at 0 °C to 70 °C				
Total power dissipation		430	mW	
Maximum current into V_{DD} or out of V_{SS}		120	mA	

Table 128. Power Consumption

		V_{DD} = 2.7 V to 3.6 V				
			Maximum[2]	Maximum[3]		
Symbol	**Parameter**	**Typical[1]**	**Std Temp**	**Ext Temp**	**Units**	**Conditions**
I_{DD} Stop	Supply Current in STOP Mode	0.1			µA	No peripherals enabled. All pins driven to V_{DD} or V_{SS}.
I_{DD} Halt	Supply Current in HALT Mode (with all peripherals disabled)	35	55	65	µA	32 kHz
		520			µA	5.5 MHz
		2.1	2.85	2.85	mA	20 MHz
I_{DD}	Supply Current in ACTIVE Mode (with all peripherals disabled)	2.8			mA	32 kHz
		4.5	5.2	5.2	mA	5.5 MHz
		5.5	6.5	6.5	mA	10 MHz
		7.9	11.5	11.5	mA	20 MHz
I_{DD} WDT	Watchdog Timer Supply Current	0.9	1.0	1.1	µA	
I_{DD} XTAL	Crystal Oscillator Supply Current	40			µA	32 kHz
		230			µA	4 MHz
		760			µA	20 MHz
I_{DD} IPO	Internal Precision Oscillator Supply Current	350	500	550	µA	
I_{DD} VBO	Voltage Brownout and Low-Voltage Detect Supply Current	50			µA	For 20-/28-pin devices (VBO only); See Notes 4
						For 8-pin devices; See Notes 4
I_{DD} ADC	Analog to Digital Converter Supply Current (with External Reference)	2.8	3.1	3.2	mA	32 kHz
		3.1	3.6	3.7	mA	5.5 MHz
		3.3	3.7	3.8	mA	10 MHz
		3.7	4.2	4.3	mA	20 MHz
I_{DD} ADCRef	ADC Internal Reference Supply Current	0			µA	See Notes 4
I_{DD} CMP	Comparator supply Current	150	180	190	µA	See Notes 4

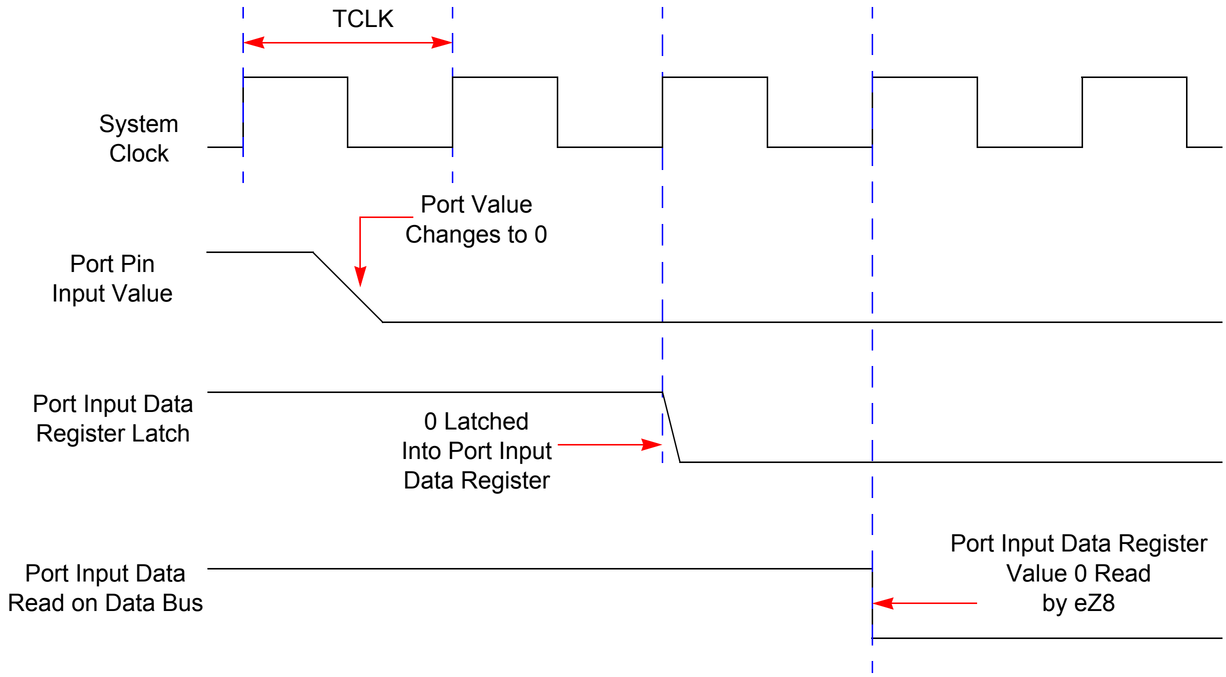

Figure 34. Port Input Sample Timing

Table 139. GPIO Port Input Timing

		Delay (ns)	
Parameter	**Abbreviation**	**Minimum**	**Maximum**
T_{S_PORT}	Port Input Transition to XIN Rise Setup Time (Not pictured)	5	–
T_{H_PORT}	XIN Rise to Port Input Transition Hold Time (Not pictured)	0	–
T_{SMR}	GPIO Port Pin Pulse Width to ensure Stop Mode Recovery (for GPIO Port Pins enabled as SMR sources)	1 µs
