

Welcome to [E-XFL.COM](#)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Obsolete
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	IrDA, UART/USART
Peripherals	Brown-out Detect/Reset, LED, LVD, POR, PWM, Temp Sensor, WDT
Number of I/O	23
Program Memory Size	4KB (4K x 8)
Program Memory Type	FLASH
EEPROM Size	128 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	-
Purchase URL	<a href="https://www.e-xfl.com/product-detail/zilog/z8f042asj020ec00tr">https://www.e-xfl.com/product-detail/zilog/z8f042asj020ec00tr</a>

# Overview

Zilog's Z8 Encore!<sup>®</sup> MCU family of products are the first in a line of Zilog<sup>®</sup> microcontroller products based upon the 8-bit eZ8 CPU. Zilog's Z8 Encore! XP<sup>®</sup> F082A Series products expand upon Zilog's extensive line of 8-bit microcontrollers. The Flash in-circuit programming capability allows for faster development time and program changes in the field. The new eZ8 CPU is upward compatible with existing Z8<sup>®</sup> instructions. The rich peripheral set of the Z8 Encore! XP F082A Series makes it suitable for a variety of applications including motor control, security systems, home appliances, personal electronic devices, and sensors.

## Features

The key features of Z8 Encore! XP F082A Series products include:

- 20 MHz eZ8 CPU
- 1 KB, 2 KB, 4 KB, or 8 KB Flash memory with in-circuit programming capability
- 256 B, 512 B, or 1 KB register RAM
- Up to 128 B non-volatile data storage (NVDS)
- Internal precision oscillator trimmed to  $\pm 1\%$  accuracy
- External crystal oscillator, operating up to 20 MHz
- Optional 8-channel, 10-bit analog-to-digital converter (ADC)
- Optional on-chip temperature sensor
- On-chip analog comparator
- Optional on-chip low-power operational amplifier (LPO)
- Full-duplex UART
- The UART baud rate generator (BRG) can be configured and used as a basic 16-bit timer
- Infrared Data Association (IrDA)-compliant infrared encoder/decoders, integrated with UART
- Two enhanced 16-bit timers with capture, compare, and PWM capability
- Watchdog Timer (WDT) with dedicated internal RC oscillator
- Up to 20 vectored interrupts
- 6 to 25 I/O pins depending upon package

## **Interrupt Controller**

The Z8 Encore! XP<sup>®</sup> F082A Series products support up to 20 interrupts. These interrupts consist of 8 internal peripheral interrupts and 12 general-purpose I/O pin interrupt sources. The interrupts have three levels of programmable interrupt priority.

## **Reset Controller**

The Z8 Encore! XP F082A Series products can be reset using the  $\overline{\text{RESET}}$  pin, Power-On Reset, Watchdog Timer (WDT) time-out, STOP mode exit, or Voltage Brownout (VBO) warning signal. The  $\overline{\text{RESET}}$  pin is bi-directional, that is, it functions as reset source as well as a reset indicator.

# Pin Description

The Z8 Encore! XP<sup>®</sup> F082A Series products are available in a variety of packages styles and pin configurations. This chapter describes the signals and available pin configurations for each of the package styles. For information on physical package specifications, see [Packaging](#) on page 241.

## Available Packages

The following package styles are available for each device in the Z8 Encore! XP F082A Series product line:

- SOIC
  - 8-, 20-, and 28-pin
- PDIP
  - 8-, 20-, and 28-pin
- SSOP
  - 20- and 28- pin
- QFN (this is an MLF-S, a QFN style package with an 8-pin SOIC footprint)
  - 8-pin

In addition, the Z8 Encore! XP F082A Series devices are available both with and without advanced analog capability (ADC, temperature sensor and op amp). Devices Z8F082A, Z8F042A, Z8F022A, and Z8F012A contain the advanced analog, while devices Z8F081A, Z8F041A, Z8F021A, and Z8F011A do not have the advanced analog capability.

## Pin Configurations

[Figure 2](#) through [Figure 4](#) display the pin configurations for all the packages available in the Z8 Encore! XP F082A Series. See [Table 2](#) on page 11 for a description of the signals. The analog input alternate functions (ANAx) are not available on the Z8F081A, Z8F041A, Z8F021A, and Z8F011A devices. The analog supply pins (AV<sub>DD</sub> and AV<sub>SS</sub>) are also not available on these parts, and are replaced by PB6 and PB7.

At reset, all Port A, B and C pins default to an input state. In addition, any alternate functionality is not enabled, so the pins function as general purpose input ports until programmed otherwise. At powerup, the PD0 pin defaults to the RESET alternate function.

mation Area data rather than the Program Memory data. Access to the Flash Information Area is read-only.

**Table 6. Z8 Encore! XP F082A Series Flash Memory Information Area Map**

Program Memory Address (Hex)	Function
FE00–FE3F	Zilog Option Bits/Calibration Data
FE40–FE53	Part Number 20-character ASCII alphanumeric code Left justified and filled with FFH
FE54–FE5F	Reserved
FE60–FE7F	Zilog Calibration Data
FE80–FFFF	Reserved

**Table 8. Reset and Stop Mode Recovery Characteristics and Latency**

Reset Characteristics and Latency			
Reset Type	Control Registers	eZ8 CPU	Reset Latency (Delay)
System Reset	Reset (as applicable)	Reset	66 Internal Precision Oscillator Cycles
System Reset with Crystal Oscillator Enabled	Reset (as applicable)	Reset	5000 Internal Precision Oscillator Cycles
Stop Mode Recovery	Unaffected, except WDT_CTL and OSC_CTL registers	Reset	66 Internal Precision Oscillator Cycles + IPO startup time
Stop Mode Recovery with Crystal Oscillator Enabled	Unaffected, except WDT_CTL and OSC_CTL registers	Reset	5000 Internal Precision Oscillator Cycles

During a System Reset or Stop Mode Recovery, the Internal Precision Oscillator requires 4  $\mu$ s to start up. Then the Z8 Encore! XP F082A Series device is held in Reset for 66 cycles of the Internal Precision Oscillator. If the crystal oscillator is enabled in the Flash option bits, this reset period is increased to 5000 IPO cycles. When a reset occurs because of a low voltage condition or Power-On Reset (POR), this delay is measured from the time that the supply voltage first exceeds the POR level. If the external pin reset remains asserted at the end of the reset period, the device remains in reset until the pin is deasserted.

At the beginning of Reset, all GPIO pins are configured as inputs with pull-up resistor disabled, except PD0 (or PA2 on 8-pin devices) which is shared with the reset pin. On reset, the PD0 is configured as a bidirectional open-drain reset. The pin is internally driven low during port reset, after which the user code may reconfigure this pin as a general purpose output.

During Reset, the eZ8 CPU and on-chip peripherals are idle; however, the on-chip crystal oscillator and Watchdog Timer oscillator continue to run.

Upon Reset, control registers within the Register File that have a defined Reset value are loaded with their reset values. Other control registers (including the Stack Pointer, Register Pointer, and Flags) and general-purpose RAM are undefined following Reset. The eZ8 CPU fetches the Reset vector at Program Memory addresses 0002H and 0003H and loads that value into the Program Counter. Program execution begins at the Reset vector address.

As the control registers are re-initialized by a system reset, the system clock after reset is always the IPO. The software must reconfigure the oscillator control block, such that the correct system clock source is enabled and selected.

# Interrupt Controller

The interrupt controller on the Z8 Encore! XP F082A Series products prioritizes the interrupt requests from the on-chip peripherals and the GPIO port pins. The features of interrupt controller include:

- 20 possible interrupt sources with 18 unique interrupt vectors:
  - Twelve GPIO port pin interrupt sources (two interrupt vectors are shared).
  - Eight on-chip peripheral interrupt sources (two interrupt vectors are shared).
- Flexible GPIO interrupts:
  - Eight selectable rising and falling edge GPIO interrupts.
  - Four dual-edge interrupts.
- Three levels of individually programmable interrupt priority.
- Watchdog Timer and LVD can be configured to generate an interrupt.
- Supports vectored as well as polled interrupts

Interrupt requests (IRQs) allow peripheral devices to suspend CPU operation in an orderly manner and force the CPU to start an interrupt service routine (ISR). Usually this interrupt service routine is involved with the exchange of data, status information, or control information between the CPU and the interrupting peripheral. When the service routine is completed, the CPU returns to the operation from which it was interrupted.

The eZ8 CPU supports both vectored and polled interrupt handling. For polled interrupts, the interrupt controller has no effect on operation. For more information on interrupt servicing by the eZ8 CPU, refer to *eZ8 CPU Core User Manual (UM0128)* available for download at [www.zilog.com](http://www.zilog.com).

## Interrupt Vector Listing

Table 32 on page 56 lists all of the interrupts available in order of priority. The interrupt vector is stored with the most-significant byte (MSB) at the even Program Memory address and the least-significant byte (LSB) at the following odd Program Memory address.

► **Note:** *Some port interrupts are not available on the 8- and 20-pin packages. The ADC interrupt is unavailable on devices not containing an ADC.*

**Table 39. IRQ1 Enable and Priority Encoding**

IRQ1ENH[x]	IRQ1ENL[x]	Priority	Description
0	0	Disabled	Disabled
0	1	Level 1	Low
1	0	Level 2	Medium
1	1	Level 3	High

where x indicates the register bits from 0–7.

**Table 40. IRQ1 Enable High Bit Register (IRQ1ENH)**

BITS	7	6	5	4	3	2	1	0
FIELD	PA7VENH	PA6CENH	PA5ENH	PA4ENH	PA3ENH	PA2ENH	PA1ENH	PA0ENH
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	FC4H							

PA7VENH—Port A Bit[7] or LVD Interrupt Request Enable High Bit

PA6CENH—Port A Bit[7] or Comparator Interrupt Request Enable High Bit

PAxENH—Port A Bit[x] Interrupt Request Enable High Bit

See Shared Interrupt Select (IRQSS) register for selection of either the LVD or the comparator as the interrupt source.

**Table 41. IRQ1 Enable Low Bit Register (IRQ1ENL)**

BITS	7	6	5	4	3	2	1	0
FIELD	PA7VENL	PA6CENL	PA5ENL	PA4ENL	PA3ENL	PA2ENL	PA1ENL	PA0ENL

PA7VENL—Port A Bit[7] or LVD Interrupt Request Enable Low Bit

PA6CENL—Port A Bit[6] or Comparator Interrupt Request Enable Low Bit

PAxENL—Port A Bit[x] Interrupt Request Enable Low Bit

If the TPOL bit in the Timer Control register is set to 0, the Timer Output signal begins as a Low (0) and transitions to a High (1) when the timer value matches the PWM value. The Timer Output signal returns to a Low (0) after the timer reaches the Reload value and is reset to 0001H.

Follow the steps below for configuring a timer for PWM SINGLE OUTPUT mode and initiating the PWM operation:

1. Write to the Timer Control register to:
  - Disable the timer.
  - Configure the timer for PWM SINGLE OUTPUT mode.
  - Set the prescale value.
  - Set the initial logic level (High or Low) and PWM High/Low transition for the Timer Output alternate function.
2. Write to the Timer High and Low Byte registers to set the starting count value (typically 0001H). This only affects the first pass in PWM mode. After the first timer reset in PWM mode, counting always begins at the reset value of 0001H.
3. Write to the PWM High and Low Byte registers to set the PWM value.
4. Write to the Timer Reload High and Low Byte registers to set the Reload value (PWM period). The Reload value must be greater than the PWM value.
5. If appropriate, enable the timer interrupt and set the timer interrupt priority by writing to the relevant interrupt registers.
6. Configure the associated GPIO port pin for the Timer Output alternate function.
7. Write to the Timer Control register to enable the timer and initiate counting.

The PWM period is represented by the following equation:

$$\text{PWM Period (s)} = \frac{\text{Reload Value} \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

If an initial starting value other than 0001H is loaded into the Timer High and Low Byte registers, use the ONE-SHOT mode equation to determine the first PWM time-out period.

If TPOL is set to 0, the ratio of the PWM output High time to the total period is represented by:

$$\text{PWM Output High Time Ratio (\%)} = \frac{\text{Reload Value} - \text{PWM Value}}{\text{Reload Value}} \times 100$$

If TPOL is set to 1, the ratio of the PWM output High time to the total period is represented by:

$$\text{PWM Output High Time Ratio (\%)} = \frac{\text{PWM Value}}{\text{Reload Value}} \times 100$$

duration of the negative phase of the PWM signal (as defined by the difference between the PWM registers and the Timer Reload registers).

5. Write to the Timer Reload High and Low Byte registers to set the Reload value (PWM period). The Reload value must be greater than the PWM value.
6. If appropriate, enable the timer interrupt and set the timer interrupt priority by writing to the relevant interrupt registers.
7. Configure the associated GPIO port pin for the Timer Output and Timer Output Complement alternate functions. The Timer Output Complement function is shared with the Timer Input function for both timers. Setting the timer mode to Dual PWM automatically switches the function from Timer In to Timer Out Complement.
8. Write to the Timer Control register to enable the timer and initiate counting.

The PWM period is represented by the following equation:

$$\text{PWM Period (s)} = \frac{\text{Reload Value} \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

If an initial starting value other than 0001H is loaded into the Timer High and Low Byte registers, the ONE-SHOT mode equation determines the first PWM time-out period.

If TPOL is set to 0, the ratio of the PWM output High time to the total period is represented by:

$$\text{PWM Output High Time Ratio (\%)} = \frac{\text{Reload Value} - \text{PWM Value}}{\text{Reload Value}} \times 100$$

If TPOL is set to 1, the ratio of the PWM output High time to the total period is represented by:

$$\text{PWM Output High Time Ratio (\%)} = \frac{\text{PWM Value}}{\text{Reload Value}} \times 100$$

### CAPTURE Mode

In CAPTURE mode, the current timer count value is recorded when the appropriate external Timer Input transition occurs. The Capture count value is written to the Timer PWM High and Low Byte Registers. The timer input is the system clock. The TPOL bit in the Timer Control register determines if the Capture occurs on a rising edge or a falling edge of the Timer Input signal. When the Capture event occurs, an interrupt is generated and the timer continues counting. The INPCAP bit in TxCTL0 register is set to indicate the timer interrupt is because of an input capture event.

The timer continues counting up to the 16-bit Reload value stored in the Timer Reload High and Low Byte registers. Upon reaching the Reload value, the timer generates an interrupt and continues counting. The INPCAP bit in TxCTL0 register clears indicating the timer interrupt is not because of an input capture event.

4. Enable the timer interrupt, if appropriate, and set the timer interrupt priority by writing to the relevant interrupt registers. By default, the timer interrupt are generated for both input capture and reload events. If appropriate, configure the timer interrupt to be generated only at the input capture event or the reload event by setting TICONFIG field of the TxCTL0 register.
5. Configure the associated GPIO port pin for the Timer Input alternate function.
6. Write to the Timer Control register to enable the timer.
7. Counting begins on the first appropriate transition of the Timer Input signal. No interrupt is generated by this first edge.

In CAPTURE/COMPARE mode, the elapsed time from timer start to Capture event can be calculated using the following equation:

$$\text{Capture Elapsed Time (s)} = \frac{(\text{Capture Value} - \text{Start Value}) \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

## Reading the Timer Count Values

The current count value in the timers can be read while counting (enabled). This capability has no effect on timer operation. When the timer is enabled and the Timer High Byte register is read, the contents of the Timer Low Byte register are placed in a holding register. A subsequent read from the Timer Low Byte register returns the value in the holding register. This operation allows accurate reads of the full 16-bit timer count value while enabled. When the timers are not enabled, a read from the Timer Low Byte register returns the actual value in the counter.

## Timer Pin Signal Operation

Timer Output is a GPIO Port pin alternate function. The Timer Output is toggled every time the counter is reloaded.

The Timer Input can be used as a selectable counting source. It shares the same pin as the complementary timer output. When selected by the GPIO Alternate Function Registers, this pin functions as a timer input in all modes except for the DUAL PWM OUTPUT mode. For this mode, there is no timer input available.

6. Check the TDRE bit in the UART Status 0 register to determine if the Transmit Data register is empty (indicated by a 1). If empty, continue to [Step 7](#). If the Transmit Data register is full (indicated by a 0), continue to monitor the TDRE bit until the Transmit Data register becomes available to receive new data.
7. Write the UART Control 1 register to select the outgoing address bit.
8. Set the Multiprocessor Bit Transmitter (MPBT) if sending an address byte, clear it if sending a data byte.
9. Write the data byte to the UART Transmit Data register. The transmitter automatically transfers the data to the Transmit Shift register and transmits the data.
10. Make any changes to the Multiprocessor Bit Transmitter (MPBT) value, if appropriate and MULTIPROCESSOR mode is enabled.
11. To transmit additional bytes, return to [Step 5](#).

### **Transmitting Data using the Interrupt-Driven Method**

The UART Transmitter interrupt indicates the availability of the Transmit Data register to accept new data for transmission. Follow the steps below to configure the UART for interrupt-driven data transmission:

1. Write to the UART Baud Rate High and Low Byte registers to set the appropriate baud rate.
2. Enable the UART pin functions by configuring the associated GPIO Port pins for alternate function operation.
3. Execute a DI instruction to disable interrupts.
4. Write to the Interrupt control registers to enable the UART Transmitter interrupt and set the acceptable priority.
5. Write to the UART Control 1 register to enable MULTIPROCESSOR (9-bit) mode functions, if MULTIPROCESSOR mode is appropriate.
6. Set the MULTIPROCESSOR Mode Select (MPEN) to Enable MULTIPROCESSOR mode.
7. Write to the UART Control 0 register to:
  - Set the transmit enable bit (TEN) to enable the UART for data transmission.
  - Enable parity, if appropriate and if MULTIPROCESSOR mode is not enabled, and select either even or odd parity.
  - Set or clear CTSE to enable or disable control from the remote receiver using the  $\overline{\text{CTS}}$  pin.
8. Execute an EI instruction to enable interrupts.

Figure 19. Analog-to-Digital Converter Block Diagram

## Operation

### Data Format

In both SINGLE-ENDED and DIFFERENTIAL modes, the effective output of the ADC is an 11-bit, signed, two's complement digital value. In DIFFERENTIAL mode, the ADC

# Internal Precision Oscillator

The internal precision oscillator (IPO) is designed for use without external components. You can either manually trim the oscillator for a non-standard frequency or use the automatic factory-trimmed version to achieve a 5.53 MHz frequency. IPO features include:

- On-chip RC oscillator that does not require external components
- Output frequency of either 5.53 MHz or 32.8 kHz (contains both a fast and a slow mode)
- Trimmed through Flash option bits with user override
- Elimination of crystals or ceramic resonators in applications where very high timing accuracy is not required

## Operation

An 8-bit trimming register, incorporated into the design, compensates for absolute variation of oscillator frequency. Once trimmed the oscillator frequency is stable and does not require subsequent calibration. Trimming is performed during manufacturing and is not necessary for you to repeat unless a frequency other than 5.53 MHz (fast mode) or 32.8 kHz (slow mode) is required. This trimming is done at +30 °C and a supply voltage of 3.3 V, so accuracy of this operating point is optimal.

If not used, the IPO can be disabled by the Oscillator Control register (see [Oscillator Control Register Definitions](#) on page 190).

By default, the oscillator frequency is set by the factory trim value stored in the write-protected Flash information page. However, the user code can override these trim values as described in [Trim Bit Address Space](#) on page 158.

Select one of two frequencies for the oscillator: 5.53 MHz and 32.8 kHz, using the OSCSEL bits in the [Oscillator Control](#) on page 187.

**Table 128. Power Consumption (Continued)**

$V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$						
Maximum <sup>2</sup> Maximum <sup>3</sup>						
Symbol	Parameter	Typical <sup>1</sup>	Std Temp	Ext Temp	Units	Conditions
$I_{DD}$ LPO	Low-Power Operational Amplifier Supply Current	3	5	5	$\mu\text{A}$	Driving a high-impedance load
$I_{DD}$ TS	Temperature Sensor Supply Current	60			$\mu\text{A}$	See <a href="#">Notes 4</a>
$I_{DD}$ BG	Band Gap Supply Current	320	480	500	$\mu\text{A}$	For 20-/28-pin devices
						For 8-pin devices

**Notes**

1. Typical conditions are defined as  $V_{DD} = 3.3 \text{ V}$  and  $+30 \text{ }^{\circ}\text{C}$ .
2. Standard temperature is defined as  $T_A = 0 \text{ }^{\circ}\text{C}$  to  $+70 \text{ }^{\circ}\text{C}$ ; these values not tested in production for worst case behavior, but are derived from product characterization and provided for design guidance only.
3. Extended temperature is defined as  $T_A = -40 \text{ }^{\circ}\text{C}$  to  $+105 \text{ }^{\circ}\text{C}$ ; these values not tested in production for worst case behavior, but are derived from product characterization and provided for design guidance only.
4. For this block to operate, the bandgap circuit is automatically turned on and must be added to the total supply current. This bandgap current is only added once, regardless of how many peripherals are using it.
