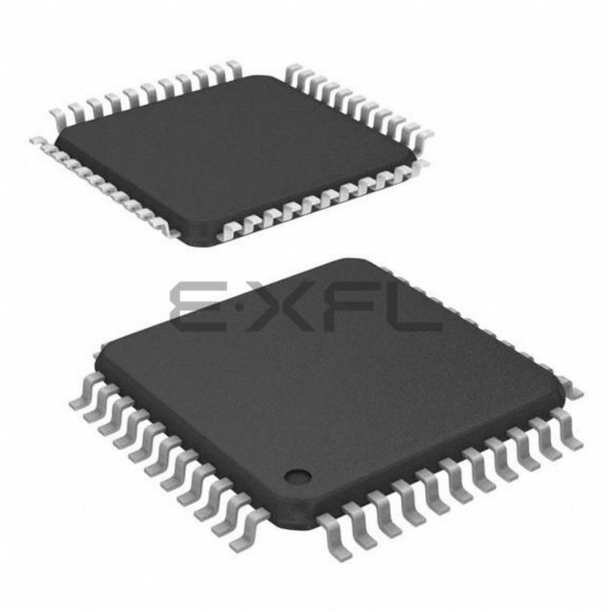
Intel - EPM7032STC44-10F Datasheet



Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	10 ns
Voltage Supply - Internal	4.75V ~ 5.25V
Number of Logic Elements/Blocks	2
Number of Macrocells	32
Number of Gates	600
Number of I/O	36
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-TQFP
Supplier Device Package	44-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/intel/epm7032stc44-10f

- Additional design entry and simulation support provided by EDIF 2 0 0 and 3 0 0 netlist files, library of parameterized modules (LPM), Verilog HDL, VHDL, and other interfaces to popular EDA tools from manufacturers such as Cadence, Exemplar Logic, Mentor Graphics, OrCAD, Synopsys, and VeriBest
- Programming support
  - Altera’s Master Programming Unit (MPU) and programming hardware from third-party manufacturers program all MAX 7000 devices
  - The BitBlaster™ serial download cable, ByteBlasterMV™ parallel port download cable, and MasterBlaster™ serial/universal serial bus (USB) download cable program MAX 7000S devices

General Description

The MAX 7000 family of high-density, high-performance PLDs is based on Altera’s second-generation MAX architecture. Fabricated with advanced CMOS technology, the EEPROM-based MAX 7000 family provides 600 to 5,000 usable gates, ISP, pin-to-pin delays as fast as 5 ns, and counter speeds of up to 175.4 MHz. MAX 7000S devices in the -5, -6, -7, and -10 speed grades as well as MAX 7000 and MAX 7000E devices in -5, -6, -7, -10P, and -12P speed grades comply with the PCI Special Interest Group (PCI SIG) ***PCI Local Bus Specification, Revision 2.2***. See Table 3 for available speed grades.

Table 3. MAX 7000 Speed Grades

Device	**Speed Grade**									
	-5	**-6**	**-7**	**-10P**	**-10**	**-12P**	**-12**	**-15**	**-15T**	**-20**
EPM7032		✓	✓		✓		✓	✓	✓	
EPM7032S	✓	✓	✓		✓					
EPM7064		✓	✓		✓		✓	✓		
EPM7064S	✓	✓	✓		✓					
EPM7096			✓		✓		✓	✓		
EPM7128E			✓	✓	✓		✓	✓		✓
EPM7128S		✓	✓		✓			✓		
EPM7160E				✓	✓		✓	✓		✓
EPM7160S		✓	✓		✓			✓		
EPM7192E						✓	✓	✓		✓
EPM7192S			✓		✓			✓		
EPM7256E						✓	✓	✓		✓
EPM7256S			✓		✓			✓		

The MAX 7000E devices—including the EPM7128E, EPM7160E, EPM7192E, and EPM7256E devices—have several enhanced features: additional global clocking, additional output enable controls, enhanced interconnect resources, fast input registers, and a programmable slew rate.

In-system programmable MAX 7000 devices—called MAX 7000S devices—include the EPM7032S, EPM7064S, EPM7128S, EPM7160S, EPM7192S, and EPM7256S devices. MAX 7000S devices have the enhanced features of MAX 7000E devices as well as JTAG BST circuitry in devices with 128 or more macrocells, ISP, and an open-drain output option. See Table 4.

Table 4. MAX 7000 Device Features

Feature	EPM7032 EPM7064 EPM7096	All MAX 7000E Devices	All MAX 7000S Devices
ISP via JTAG interface			✓
JTAG BST circuitry			✓ *(1)*
Open-drain output option			✓
Fast input registers		✓	✓
Six global output enables		✓	✓
Two global clocks		✓	✓
Slew-rate control		✓	✓
MultiVolt interface *(2)*	✓	✓	✓
Programmable register	✓	✓	✓
Parallel expanders	✓	✓	✓
Shared expanders	✓	✓	✓
Power-saving mode	✓	✓	✓
Security bit	✓	✓	✓
PCI-compliant devices available	✓	✓	✓

Notes:

(1) Available only in EPM7128S, EPM7160S, EPM7192S, and EPM7256S devices only.

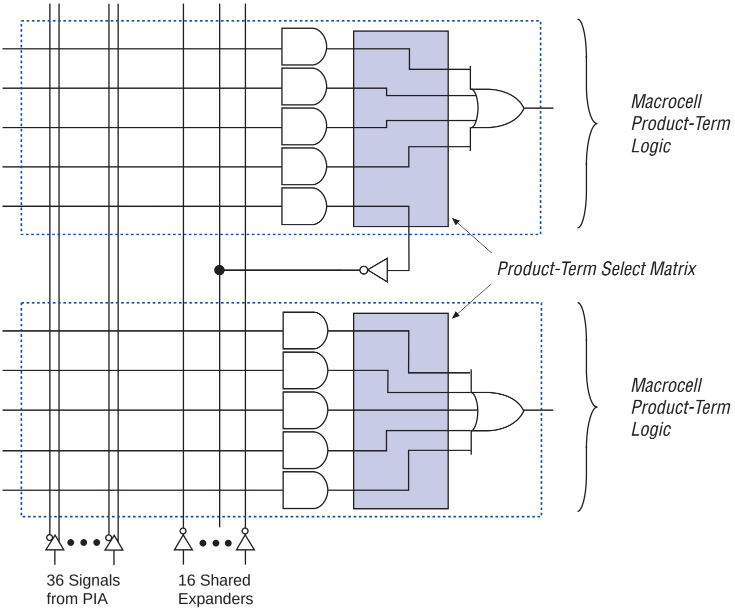
(2) The MultiVolt I/O interface is not available in 44-pin packages.

Shareable Expanders

Each LAB has 16 shareable expanders that can be viewed as a pool of uncommitted single product terms (one from each macrocell) with inverted outputs that feed back into the logic array. Each shareable expander can be used and shared by any or all macrocells in the LAB to build complex logic functions. A small delay (t_{SEXP}) is incurred when shareable expanders are used. Figure 5 shows how shareable expanders can feed multiple macrocells.

Figure 5. Shareable Expanders

Shareable expanders can be shared by any or all macrocells in an LAB.



Parallel Expanders

Parallel expanders are unused product terms that can be allocated to a neighboring macrocell to implement fast, complex logic functions. Parallel expanders allow up to 20 product terms to directly feed the macrocell `OR` logic, with five product terms provided by the macrocell and 15 parallel expanders provided by neighboring macrocells in the LAB.

When the tri-state buffer control is connected to ground, the output is tri-stated (high impedance) and the I/O pin can be used as a dedicated input. When the tri-state buffer control is connected to V_{CC}, the output is enabled.

The MAX 7000 architecture provides dual I/O feedback, in which macrocell and pin feedbacks are independent. When an I/O pin is configured as an input, the associated macrocell can be used for buried logic.

In-System Programmability (ISP)

MAX 7000S devices are in-system programmable via an industry-standard 4-pin Joint Test Action Group (JTAG) interface (IEEE Std. 1149.1-1990). ISP allows quick, efficient iterations during design development and debugging cycles. The MAX 7000S architecture internally generates the high programming voltage required to program EEPROM cells, allowing in-system programming with only a single 5.0 V power supply. During in-system programming, the I/O pins are tri-stated and pulled-up to eliminate board conflicts. The pull-up value is nominally 50 k¾.

ISP simplifies the manufacturing flow by allowing devices to be mounted on a printed circuit board with standard in-circuit test equipment before they are programmed. MAX 7000S devices can be programmed by downloading the information via in-circuit testers (ICT), embedded processors, or the Altera MasterBlaster, ByteBlasterMV, ByteBlaster, BitBlaster download cables. (The ByteBlaster cable is obsolete and is replaced by the ByteBlasterMV cable, which can program and configure 2.5-V, 3.3-V, and 5.0-V devices.) Programming the devices after they are placed on the board eliminates lead damage on high-pin-count packages (e.g., QFP packages) due to device handling and allows devices to be reprogrammed after a system has already shipped to the field. For example, product upgrades can be performed in the field via software or modem.

In-system programming can be accomplished with either an adaptive or constant algorithm. An adaptive algorithm reads information from the unit and adapts subsequent programming steps to achieve the fastest possible programming time for that unit. Because some in-circuit testers cannot support an adaptive algorithm, Altera offers devices tested with a constant algorithm. Devices tested to the constant algorithm have an “F” suffix in the ordering code.

The Jam™ Standard Test and Programming Language (STAPL) can be used to program MAX 7000S devices with in-circuit testers, PCs, or embedded processor.

For more information on using the Jam language, refer to *AN 122: Using Jam STAPL for ISP & ICR via an Embedded Processor*.

The ISP circuitry in MAX 7000S devices is compatible with IEEE Std. 1532 specification. The IEEE Std. 1532 is a standard developed to allow concurrent ISP between multiple PLD vendors.

Programming Sequence

During in-system programming, instructions, addresses, and data are shifted into the MAX 7000S device through the `TDI` input pin. Data is shifted out through the `TDO` output pin and compared against the expected data.

Programming a pattern into the device requires the following six ISP stages. A stand-alone verification of a programmed pattern involves only stages 1, 2, 5, and 6.

1. *Enter ISP*. The enter ISP stage ensures that the I/O pins transition smoothly from user mode to ISP mode. The enter ISP stage requires 1 ms.

2. *Check ID*. Before any program or verify process, the silicon ID is checked. The time required to read this silicon ID is relatively small compared to the overall programming time.

3. *Bulk Erase*. Erasing the device in-system involves shifting in the instructions to erase the device and applying one erase pulse of 100 ms.

4. *Program*. Programming the device in-system involves shifting in the address and data and then applying the programming pulse to program the EEPROM cells. This process is repeated for each EEPROM address.

5. *Verify*. Verifying an Altera device in-system involves shifting in addresses, applying the read pulse to verify the EEPROM cells, and shifting out the data for comparison. This process is repeated for each EEPROM address.

6. *Exit ISP*. An exit ISP stage ensures that the I/O pins transition smoothly from ISP mode to user mode. The exit ISP stage requires 1 ms.

Programmable Speed/Power Control

MAX 7000 devices offer a power-saving mode that supports low-power operation across user-defined signal paths or the entire device. This feature allows total power dissipation to be reduced by 50% or more, because most logic applications require only a small fraction of all gates to operate at maximum frequency.

The designer can program each individual macrocell in a MAX 7000 device for either high-speed (i.e., with the Turbo Bit™ option turned on) or low-power (i.e., with the Turbo Bit option turned off) operation. As a result, speed-critical paths in the design can run at high speed, while the remaining paths can operate at reduced power. Macrocells that run at low power incur a nominal timing delay adder (t_{LPA}) for the t_{LAD}, t_{LAC}, t_{IC}, t_{EN}, and t_{SEXP}, $\mathbf{t_{ACL}}$, and $\mathbf{t_{CPPW}}$ parameters.

Output Configuration

MAX 7000 device outputs can be programmed to meet a variety of system-level requirements.

MultiVolt I/O Interface

MAX 7000 devices—except 44-pin devices—support the MultiVolt I/O interface feature, which allows MAX 7000 devices to interface with systems that have differing supply voltages. The 5.0-V devices in all packages can be set for 3.3-V or 5.0-V I/O pin operation. These devices have one set of `VCC` pins for internal operation and input buffers (`VCCINT`), and another set for I/O output drivers (`VCCIO`).

The `VCCINT` pins must always be connected to a 5.0-V power supply. With a 5.0-V V_{CCINT} level, input voltage thresholds are at TTL levels, and are therefore compatible with both 3.3-V and 5.0-V inputs.

The `VCCIO` pins can be connected to either a 3.3-V or a 5.0-V power supply, depending on the output requirements. When the `VCCIO` pins are connected to a 5.0-V supply, the output levels are compatible with 5.0-V systems. When V_{CCIO} is connected to a 3.3-V supply, the output high is 3.3 V and is therefore compatible with 3.3-V or 5.0-V systems. Devices operating with V_{CCIO} levels lower than 4.75 V incur a nominally greater timing delay of t_{OD2} instead of t_{OD1}.

Open-Drain Output Option (MAX 7000S Devices Only)

MAX 7000S devices provide an optional open-drain (functionally equivalent to open-collector) output for each I/O pin. This open-drain output enables the device to provide system-level control signals (e.g., interrupt and write enable signals) that can be asserted by any of several devices. It can also provide an additional wired-`OR` plane.

By using an external 5.0-V pull-up resistor, output pins on MAX 7000S devices can be set to meet 5.0-V CMOS input voltages. When V_{CCIO} is 3.3 V, setting the open drain option will turn off the output pull-up transistor, allowing the external pull-up resistor to pull the output high enough to meet 5.0-V CMOS input voltages. When V_{CCIO} is 5.0 V, setting the output drain option is not necessary because the pull-up transistor will already turn off when the pin exceeds approximately 3.8 V, allowing the external pull-up resistor to pull the output high enough to meet 5.0-V CMOS input voltages.

Slew-Rate Control

The output buffer for each MAX 7000E and MAX 7000S I/O pin has an adjustable output slew rate that can be configured for low-noise or high-speed performance. A faster slew rate provides high-speed transitions for high-performance systems. However, these fast transitions may introduce noise transients into the system. A slow slew rate reduces system noise, but adds a nominal delay of 4 to 5 ns. In MAX 7000E devices, when the Turbo Bit is turned off, the slew rate is set for low noise performance. For MAX 7000S devices, each I/O pin has an individual EEPROM bit that controls the slew rate, allowing designers to specify the slew rate on a pin-by-pin basis.

Programming with External Hardware

MAX 7000 devices can be programmed on Windows-based PCs with the Altera Logic Programmer card, the Master Programming Unit (MPU), and the appropriate device adapter. The MPU performs a continuity check to ensure adequate electrical contact between the adapter and the device.

For more information, see the *Altera Programming Hardware Data Sheet*.

The Altera development system can use text- or waveform-format test vectors created with the Text Editor or Waveform Editor to test the programmed device. For added design verification, designers can perform functional testing to compare the functional behavior of a MAX 7000 device with the results of simulation. Moreover, Data I/O, BP Microsystems, and other programming hardware manufacturers also provide programming support for Altera devices.

For more information, see the *Programming Hardware Manufacturers*.

Operating Conditions

Tables 13 through 18 provide information about absolute maximum ratings, recommended operating conditions, operating conditions, and capacitance for 5.0-V MAX 7000 devices.

Table 13. MAX 7000 5.0-V Device Absolute Maximum Ratings Note (1)

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CC}	Supply voltage	With respect to ground (2)	–2.0	7.0	V
V_I	DC input voltage		–2.0	7.0	V
I_{OUT}	DC output current, per pin		–25	25	mA
T_{STG}	Storage temperature	No bias	–65	150	° C
T_{AMB}	Ambient temperature	Under bias	–65	135	° C
T_J	Junction temperature	Ceramic packages, under bias		150	° C
		PQFP and RQFP packages, under bias		135	° C

Table 14. MAX 7000 5.0-V Device Recommended Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage for internal logic and input buffers	(3), (4), (5)	4.75 (4.50)	5.25 (5.50)	V
V_{CCIO}	Supply voltage for output drivers, 5.0-V operation	(3), (4)	4.75 (4.50)	5.25 (5.50)	V
	Supply voltage for output drivers, 3.3-V operation	(3), (4), (6)	3.00 (3.00)	3.60 (3.60)	V
V_{CCISP}	Supply voltage during ISP	(7)	4.75	5.25	V
V_I	Input voltage		–0.5 (8)	V_{CCINT} + 0.5	V
V_O	Output voltage		0	V_{CCIO}	V
T_A	Ambient temperature	For commercial use	0	70	° C
		For industrial use	–40	85	° C
T_J	Junction temperature	For commercial use	0	90	° C
		For industrial use	–40	105	° C
t_R	Input rise time			40	ns
t_F	Input fall time			40	ns

t_{FSU}	Register setup time of fast input		1.9		1.8		1.7		3.0		ns
t_{FH}	Register hold time of fast input		0.6		0.7		0.8		0.5		ns
t_{RD}	Register delay			1.2		1.6		1.9		2.0	ns
t_{COMB}	Combinatorial delay			0.9		1.1		1.4		2.0	ns
t_{IC}	Array clock delay			2.7		3.4		4.2		5.0	ns
t_{EN}	Register enable time			2.6		3.3		4.0		5.0	ns
t_{GLOB}	Global control delay			1.6		1.4		1.7		1.0	ns
t_{PRE}	Register preset time			2.0		2.4		3.0		3.0	ns
t_{CLR}	Register clear time			2.0		2.4		3.0		3.0	ns

Table 28. EPM7032S Internal Timing Parameters *Note (1)*

Symbol	Parameter	Conditions	Speed Grade								Unit
			-5		-6		-7		-10		
			Min	Max	Min	Max	Min	Max	Min	Max	
t_{PIA}	PIA delay	*(7)*		1.1		1.1		1.4		1.0	ns
t_{LPA}	Low-power adder	*(8)*		12.0		10.0		10.0		11.0	ns

Notes to tables:

(1) These values are specified under the recommended operating conditions shown in Table 14. See Figure 13 for more information on switching waveforms.

(2) This minimum pulse width for preset and clear applies for both global clear and array controls. The t_{LPA} parameter must be added to this minimum width if the clear or reset signal incorporates the t_{LAD} parameter into the signal path.

(3) This parameter is a guideline that is sample-tested only and is based on extensive device characterization. This parameter applies for both global and array clocking.

(4) These parameters are measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.

(5) The $\mathbf{f_{MAX}}$ values represent the highest frequency for pipelined data.

(6) Operating conditions: V_{CCIO} = 3.3 V ± 10% for commercial and industrial use.

(7) For EPM7064S-5, EPM7064S-6, EPM7128S-6, EPM7160S-6, EPM7160S-7, EPM7192S-7, and EPM7256S-7 devices, these values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.

(8) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{EN}, t_{SEXP}, $\mathbf{t_{ACL}}$, and $\mathbf{t_{CPPW}}$ parameters for macrocells running in the low-power mode.

Tables 29 and 30 show the EPM7064S AC operating conditions.

Table 29. EPM7064S External Timing Parameters (Part 1 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade								Unit
			-5		-6		-7		-10		
			Min	Max	Min	Max	Min	Max	Min	Max	
t_{PD1}	Input to non-registered output	C1 = 35 pF		5.0		6.0		7.5		10.0	ns
t_{PD2}	I/O input to non-registered output	C1 = 35 pF		5.0		6.0		7.5		10.0	ns
t_{SU}	Global clock setup time		2.9		3.6		6.0		7.0		ns
t_{H}	Global clock hold time		0.0		0.0		0.0		0.0		ns
t_{FSU}	Global clock setup time of fast input		2.5		2.5		3.0		3.0		ns
t_{FH}	Global clock hold time of fast input		0.0		0.0		0.5		0.5		ns
t_{CO1}	Global clock to output delay	C1 = 35 pF		3.2		4.0		4.5		5.0	ns
t_{CH}	Global clock high time		2.0		2.5		3.0		4.0		ns
t_{CL}	Global clock low time		2.0		2.5		3.0		4.0		ns
t_{ASU}	Array clock setup time		0.7		0.9		3.0		2.0		ns
t_{AH}	Array clock hold time		1.8		2.1		2.0		3.0		ns

Table 30. EPM7064S Internal Timing Parameters (Part 2 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade								Unit
			-5		-6		-7		-10		
			Min	Max	Min	Max	Min	Max	Min	Max	
t_{FSU}	Register setup time of fast input		1.9		1.8		3.0		3.0		ns
t_{FH}	Register hold time of fast input		0.6		0.7		0.5		0.5		ns
t_{RD}	Register delay			1.2		1.6		1.0		2.0	ns
t_{COMB}	Combinatorial delay			0.9		1.0		1.0		2.0	ns
t_{IC}	Array clock delay			2.7		3.3		3.0		5.0	ns
t_{EN}	Register enable time			2.6		3.2		3.0		5.0	ns
t_{GLOB}	Global control delay			1.6		1.9		1.0		1.0	ns
t_{PRE}	Register preset time			2.0		2.4		2.0		3.0	ns
t_{CLR}	Register clear time			2.0		2.4		2.0		3.0	ns
t_{PIA}	PIA delay	*(7)*		1.1		1.3		1.0		1.0	ns
t_{LPA}	Low-power adder	*(8)*		12.0		11.0		10.0		11.0	ns

Notes to tables:

(1) These values are specified under the recommended operating conditions shown in Table 14. See Figure 13 for more information on switching waveforms.

(2) This minimum pulse width for preset and clear applies for both global clear and array controls. The t_{LPA} parameter must be added to this minimum width if the clear or reset signal incorporates the t_{LAD} parameter into the signal path.

(3) This parameter is a guideline that is sample-tested only and is based on extensive device characterization. This parameter applies for both global and array clocking.

(4) These parameters are measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.

(5) The $\mathbf{f_{MAX}}$ values represent the highest frequency for pipelined data.

(6) Operating conditions: V_{CCIO} = 3.3 V ± 10% for commercial and industrial use.

(7) For EPM7064S-5, EPM7064S-6, EPM7128S-6, EPM7160S-6, EPM7160S-7, EPM7192S-7, and EPM7256S-7 devices, these values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.

(8) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{EN}, t_{SEXP}, $\mathbf{t_{ACL}}$, and $\mathbf{t_{CPPW}}$ parameters for macrocells running in the low-power mode.

Figures 16 through 22 show the package pin-out diagrams for MAX 7000 devices.

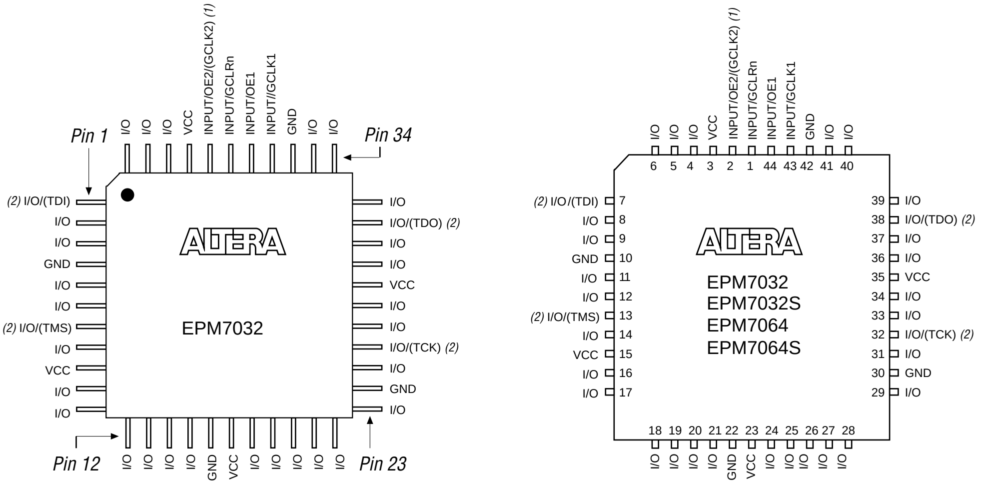
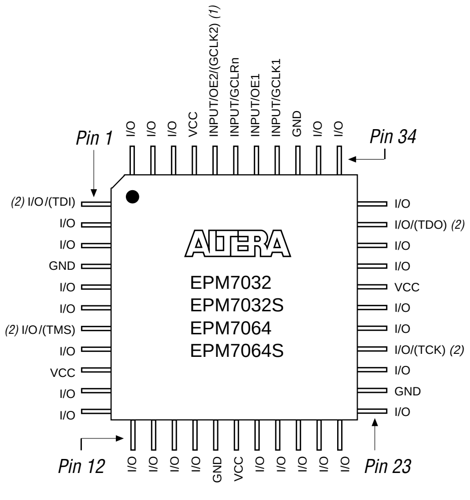
Package outlines not drawn to scale.



44-Pin PQFP

44-Pin PLCC



44-Pin TQFP

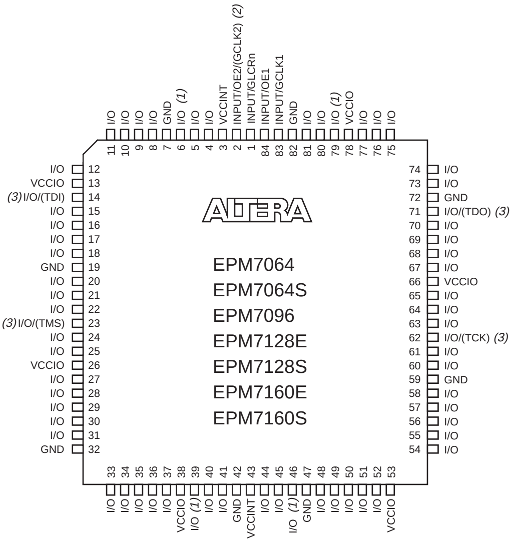
Notes:

(1) The pin functions shown in parenthesis are only available in MAX 7000E and MAX 7000S devices.

(2) JTAG ports are available in MAX 7000S devices only.

Figure 18. 84-Pin Package Pin-Out Diagram

Package outline not drawn to scale.



84-Pin PLCC

Notes:

(1) Pins 6, 39, 46, and 79 are no-connect (N.C.) pins on EPM7096, EPM7160E, and EPM7160S devices.
(2) The pin functions shown in parenthesis are only available in MAX 7000E and MAX 7000S devices.
(3) JTAG ports are available in MAX 7000S devices only.
