Welcome to E-XFL.COM

Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	6 ns
Voltage Supply - Internal	4.75V ~ 5.25V
Number of Logic Elements/Blocks	4
Number of Macrocells	64
Number of Gates	1250
Number of I/O	68
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)
Purchase URL	https://www.e-xfl.com/product-detail/intel/epm7064slc84-6

The MAX 7000E devices—including the EPM7128E, EPM7160E, EPM7192E, and EPM7256E devices—have several enhanced features: additional global clocking, additional output enable controls, enhanced interconnect resources, fast input registers, and a programmable slew rate.

In-system programmable MAX 7000 devices—called MAX 7000S devices—include the EPM7032S, EPM7064S, EPM7128S, EPM7160S, EPM7192S, and EPM7256S devices. MAX 7000S devices have the enhanced features of MAX 7000E devices as well as JTAG BST circuitry in devices with 128 or more macrocells, ISP, and an open-drain output option. See Table 4.

Table 4. MAX 7000 Device Features

Feature	EPM7032 EPM7064 EPM7096	All MAX 7000E Devices	All MAX 7000S Devices
ISP via JTAG interface			✓
JTAG BST circuitry			✓ *(1)*
Open-drain output option			✓
Fast input registers		✓	✓
Six global output enables		✓	✓
Two global clocks		✓	✓
Slew-rate control		✓	✓
MultiVolt interface *(2)*	✓	✓	✓
Programmable register	✓	✓	✓
Parallel expanders	✓	✓	✓
Shared expanders	✓	✓	✓
Power-saving mode	✓	✓	✓
Security bit	✓	✓	✓
PCI-compliant devices available	✓	✓	✓

Notes:
(1) Available only in EPM7128S, EPM7160S, EPM7192S, and EPM7256S devices only.
(2) The MultiVolt I/O interface is not available in 44-pin packages.

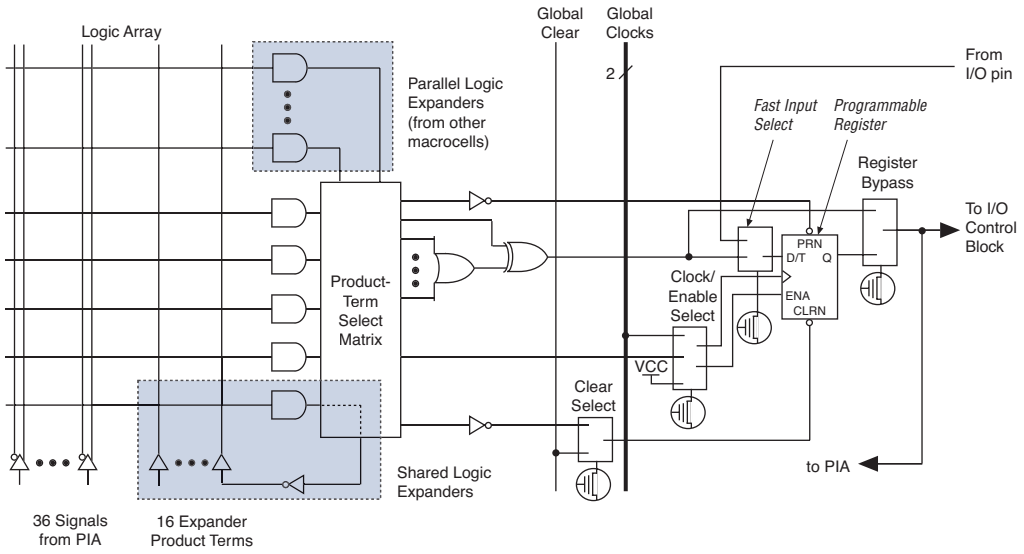
Each LAB is fed by the following signals:

- 36 signals from the PIA that are used for general logic inputs
- Global controls that are used for secondary register functions
- Direct input paths from I/O pins to the registers that are used for fast setup times for MAX 7000E and MAX 7000S devices

Macrocells

The MAX 7000 macrocell can be individually configured for either sequential or combinatorial logic operation. The macrocell consists of three functional blocks: the logic array, the product-term select matrix, and the programmable register. The macrocell of EPM7032, EPM7064, and EPM7096 devices is shown in Figure 3.

Figure 3. EPM7032, EPM7064 & EPM7096 Device Macrocell

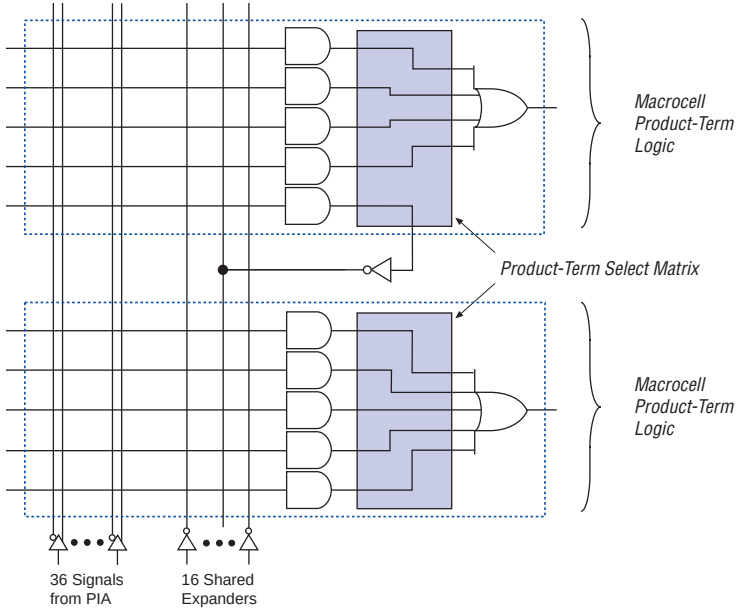


Shareable Expanders

Each LAB has 16 shareable expanders that can be viewed as a pool of uncommitted single product terms (one from each macrocell) with inverted outputs that feed back into the logic array. Each shareable expander can be used and shared by any or all macrocells in the LAB to build complex logic functions. A small delay (t_{SEXP}) is incurred when shareable expanders are used. Figure 5 shows how shareable expanders can feed multiple macrocells.

Figure 5. Shareable Expanders

Shareable expanders can be shared by any or all macrocells in an LAB.



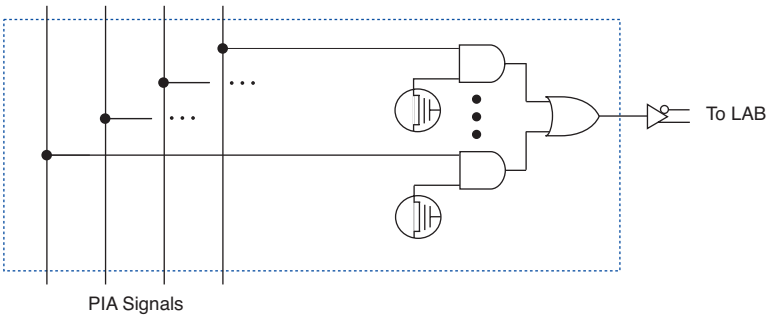
Parallel Expanders

Parallel expanders are unused product terms that can be allocated to a neighboring macrocell to implement fast, complex logic functions. Parallel expanders allow up to 20 product terms to directly feed the macrocell OR logic, with five product terms provided by the macrocell and 15 parallel expanders provided by neighboring macrocells in the LAB.

Programmable Interconnect Array

Logic is routed between LABs via the programmable interconnect array (PIA). This global bus is a programmable path that connects any signal source to any destination on the device. All MAX 7000 dedicated inputs, I/O pins, and macrocell outputs feed the PIA, which makes the signals available throughout the entire device. Only the signals required by each LAB are actually routed from the PIA into the LAB. Figure 7 shows how the PIA signals are routed into the LAB. An EEPROM cell controls one input to a 2-input AND gate, which selects a PIA signal to drive into the LAB.

Figure 7. PIA Routing



While the routing delays of channel-based routing schemes in masked or FPGAs are cumulative, variable, and path-dependent, the MAX 7000 PIA has a fixed delay. The PIA thus eliminates skew between signals and makes timing performance easy to predict.

I/O Control Blocks

The I/O control block allows each I/O pin to be individually configured for input, output, or bidirectional operation. All I/O pins have a tri-state buffer that is individually controlled by one of the global output enable signals or directly connected to ground or V_{CC}. Figure 8 shows the I/O control block for the MAX 7000 family. The I/O control block of EPM7032, EPM7064, and EPM7096 devices has two global output enable signals that are driven by two dedicated active-low output enable pins (OE1 and OE2). The I/O control block of MAX 7000E and MAX 7000S devices has six global output enable signals that are driven by the true or complement of two output enable signals, a subset of the I/O pins, or a subset of the I/O macrocells.

Programming Times

The time required to implement each of the six programming stages can be broken into the following two elements:

- A pulse time to erase, program, or read the EEPROM cells.
- A shifting time based on the test clock (TCK) frequency and the number of TCK cycles to shift instructions, address, and data into the device.

By combining the pulse and shift times for each of the programming stages, the program or verify time can be derived as a function of the TCK frequency, the number of devices, and specific target device(s). Because different ISP-capable devices have a different number of EEPROM cells, both the total fixed and total variable times are unique for a single device.

Programming a Single MAX 7000S Device

The time required to program a single MAX 7000S device in-system can be calculated from the following formula:

$$t_{PROG} = t_{PPULSE} + \frac{Cycle_{PTCK}}{f_{TCK}}$$

where: t_{PROG} = Programming time
t_{PPULSE} = Sum of the fixed times to erase, program, and verify the EEPROM cells
$Cycle_{PTCK}$ = Number of TCK cycles to program a device
f_{TCK} = TCK frequency

The ISP times for a stand-alone verification of a single MAX 7000S device can be calculated from the following formula:

$$t_{VER} = t_{VPULSE} + \frac{Cycle_{VTCK}}{f_{TCK}}$$

where: t_{VER} = Verify time
t_{VPULSE} = Sum of the fixed times to verify the EEPROM cells
$Cycle_{VTCK}$ = Number of TCK cycles to verify a device

The programming times described in Tables 6 through 8 are associated with the worst-case method using the enhanced ISP algorithm.

Table 6. MAX 7000S t_{PULSE} & $Cycle_{TCK}$ Values

Device	Programming		Stand-Alone Verification	
	t_{PPULSE} (s)	$Cycle_{PTCK}$	t_{VPULSE} (s)	$Cycle_{VTCK}$
EPM7032S	4.02	342,000	0.03	200,000
EPM7064S	4.50	504,000	0.03	308,000
EPM7128S	5.11	832,000	0.03	528,000
EPM7160S	5.35	1,001,000	0.03	640,000
EPM7192S	5.71	1,192,000	0.03	764,000
EPM7256S	6.43	1,603,000	0.03	1,024,000

Tables 7 and 8 show the in-system programming and stand alone verification times for several common test clock frequencies.

Table 7. MAX 7000S In-System Programming Times for Different Test Clock Frequencies

Device	f_{TCK}								Units
	10 MHz	5 MHz	2 MHz	1 MHz	500 kHz	200 kHz	100 kHz	50 kHz	
EPM7032S	4.06	4.09	4.19	4.36	4.71	5.73	7.44	10.86	s
EPM7064S	4.55	4.60	4.76	5.01	5.51	7.02	9.54	14.58	s
EPM7128S	5.19	5.27	5.52	5.94	6.77	9.27	13.43	21.75	s
EPM7160S	5.45	5.55	5.85	6.35	7.35	10.35	15.36	25.37	s
EPM7192S	5.83	5.95	6.30	6.90	8.09	11.67	17.63	29.55	s

Table 8. MAX 7000S Stand-Alone Verification Times for Different Test Clock Frequencies

Device	f_{TCK}								Units
	10 MHz	5 MHz	2 MHz	1 MHz	500 kHz	200 kHz	100 kHz	50 kHz	
EPM7032S	0.05	0.07	0.13	0.23	0.43	1.03	2.03	4.03	s
EPM7064S	0.06	0.09	0.18	0.34	0.64	1.57	3.11	6.19	s
EPM7128S	0.08	0.14	0.29	0.56	1.09	2.67	5.31	10.59	s
EPM7160S	0.09	0.16	0.35	0.67	1.31	3.23	6.43	12.83	s
EPM7192S	0.11	0.18	0.41	0.79	1.56	3.85	7.67	15.31	s
EPM7256S	0.13	0.24	0.54	1.06	2.08	5.15	10.27	20.51	s

Programmable Speed/Power Control

MAX 7000 devices offer a power-saving mode that supports low-power operation across user-defined signal paths or the entire device. This feature allows total power dissipation to be reduced by 50% or more, because most logic applications require only a small fraction of all gates to operate at maximum frequency.

The designer can program each individual macrocell in a MAX 7000 device for either high-speed (i.e., with the Turbo Bit™ option turned on) or low-power (i.e., with the Turbo Bit option turned off) operation. As a result, speed-critical paths in the design can run at high speed, while the remaining paths can operate at reduced power. Macrocells that run at low power incur a nominal timing delay adder (t_{LPA}) for the t_{LAD}, t_{LAC}, t_{IC}, t_{EN}, and t_{SEXP}, $\mathbf{t_{ACL}}$, and $\mathbf{t_{CPPW}}$ parameters.

Output Configuration

MAX 7000 device outputs can be programmed to meet a variety of system-level requirements.

MultiVolt I/O Interface

MAX 7000 devices—except 44-pin devices—support the MultiVolt I/O interface feature, which allows MAX 7000 devices to interface with systems that have differing supply voltages. The 5.0-V devices in all packages can be set for 3.3-V or 5.0-V I/O pin operation. These devices have one set of `VCC` pins for internal operation and input buffers (`VCCINT`), and another set for I/O output drivers (`VCCIO`).

The `VCCINT` pins must always be connected to a 5.0-V power supply. With a 5.0-V V_{CCINT} level, input voltage thresholds are at TTL levels, and are therefore compatible with both 3.3-V and 5.0-V inputs.

The `VCCIO` pins can be connected to either a 3.3-V or a 5.0-V power supply, depending on the output requirements. When the `VCCIO` pins are connected to a 5.0-V supply, the output levels are compatible with 5.0-V systems. When V_{CCIO} is connected to a 3.3-V supply, the output high is 3.3 V and is therefore compatible with 3.3-V or 5.0-V systems. Devices operating with V_{CCIO} levels lower than 4.75 V incur a nominally greater timing delay of t_{OD2} instead of t_{OD1}.

Open-Drain Output Option (MAX 7000S Devices Only)

MAX 7000S devices provide an optional open-drain (functionally equivalent to open-collector) output for each I/O pin. This open-drain output enables the device to provide system-level control signals (e.g., interrupt and write enable signals) that can be asserted by any of several devices. It can also provide an additional wired-`OR` plane.

By using an external 5.0-V pull-up resistor, output pins on MAX 7000S devices can be set to meet 5.0-V CMOS input voltages. When V_{CCIO} is 3.3 V, setting the open drain option will turn off the output pull-up transistor, allowing the external pull-up resistor to pull the output high enough to meet 5.0-V CMOS input voltages. When V_{CCIO} is 5.0 V, setting the output drain option is not necessary because the pull-up transistor will already turn off when the pin exceeds approximately 3.8 V, allowing the external pull-up resistor to pull the output high enough to meet 5.0-V CMOS input voltages.

Slew-Rate Control

The output buffer for each MAX 7000E and MAX 7000S I/O pin has an adjustable output slew rate that can be configured for low-noise or high-speed performance. A faster slew rate provides high-speed transitions for high-performance systems. However, these fast transitions may introduce noise transients into the system. A slow slew rate reduces system noise, but adds a nominal delay of 4 to 5 ns. In MAX 7000E devices, when the Turbo Bit is turned off, the slew rate is set for low noise performance. For MAX 7000S devices, each I/O pin has an individual EEPROM bit that controls the slew rate, allowing designers to specify the slew rate on a pin-by-pin basis.

Programming with External Hardware

MAX 7000 devices can be programmed on Windows-based PCs with the Altera Logic Programmer card, the Master Programming Unit (MPU), and the appropriate device adapter. The MPU performs a continuity check to ensure adequate electrical contact between the adapter and the device.

For more information, see the *Altera Programming Hardware Data Sheet*.

The Altera development system can use text- or waveform-format test vectors created with the Text Editor or Waveform Editor to test the programmed device. For added design verification, designers can perform functional testing to compare the functional behavior of a MAX 7000 device with the results of simulation. Moreover, Data I/O, BP Microsystems, and other programming hardware manufacturers also provide programming support for Altera devices.

For more information, see the *Programming Hardware Manufacturers*.

IEEE Std. 1149.1 (JTAG) Boundary-Scan Support

MAX 7000 devices support JTAG BST circuitry as specified by IEEE Std. 1149.1-1990. Table 9 describes the JTAG instructions supported by the MAX 7000 family. The pin-out tables (see the Altera web site (**http://www.altera.com**) or the *Altera Digital Library* for pin-out information) show the location of the JTAG control pins for each device. If the JTAG interface is not required, the JTAG pins are available as user I/O pins.

Table 9. MAX 7000 JTAG Instructions

JTAG Instruction	Devices	Description
SAMPLE/PRELOAD	EPM7128S EPM7160S EPM7192S EPM7256S	Allows a snapshot of signals at the device pins to be captured and examined during normal device operation, and permits an initial data pattern output at the device pins.
EXTEST	EPM7128S EPM7160S EPM7192S EPM7256S	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
BYPASS	EPM7032S EPM7064S EPM7128S EPM7160S EPM7192S EPM7256S	Places the 1-bit bypass register between the `TDI` and `TDO` pins, which allows the BST data to pass synchronously through a selected device to adjacent devices during normal device operation.
IDCODE	EPM7032S EPM7064S EPM7128S EPM7160S EPM7192S EPM7256S	Selects the IDCODE register and places it between `TDI` and `TDO`, allowing the IDCODE to be serially shifted out of `TDO`.
ISP Instructions	EPM7032S EPM7064S EPM7128S EPM7160S EPM7192S EPM7256S	These instructions are used when programming MAX 7000S devices via the JTAG ports with the MasterBlaster, ByteBlasterMV, BitBlaster download cable, or using a Jam File (**.jam**), Jam Byte-Code file (**.jbc**), or Serial Vector Format file (**.svf**) via an embedded processor or test equipment.

Design Security

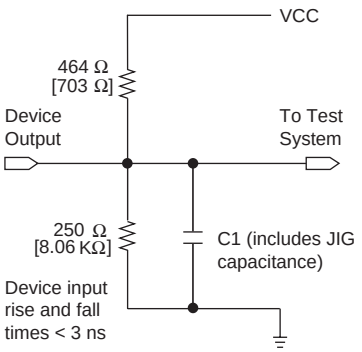
All MAX 7000 devices contain a programmable security bit that controls access to the data programmed into the device. When this bit is programmed, a proprietary design implemented in the device cannot be copied or retrieved. This feature provides a high level of design security because programmed data within EEPROM cells is invisible. The security bit that controls this function, as well as all other programmed data, is reset only when the device is reprogrammed.

Generic Testing

Each MAX 7000 device is functionally tested. Complete testing of each programmable EEPROM bit and all internal logic elements ensures 100% programming yield. AC test measurements are taken under conditions equivalent to those shown in Figure 10. Test patterns can be used and then erased during early stages of the production flow.

Figure 10. MAX 7000 AC Test Conditions

Power supply transients can affect AC measurements. Simultaneous transitions of multiple outputs should be avoided for accurate measurement. Threshold tests must not be performed under AC conditions. Large-amplitude, fast ground-current transients normally occur as the device outputs discharge the load capacitances. When these transients flow through the parasitic inductance between the device ground pin and the test system ground, significant reductions in observable noise immunity can result. Numbers in brackets are for 2.5-V devices and outputs. Numbers without brackets are for 3.3-V devices and outputs.



QFP Carrier & Development Socket

MAX 7000 and MAX 7000E devices in QFP packages with 100 or more pins are shipped in special plastic carriers to protect the QFP leads. The carrier is used with a prototype development socket and special programming hardware available from Altera. This carrier technology makes it possible to program, test, erase, and reprogram a device without exposing the leads to mechanical stress.

For detailed information and carrier dimensions, refer to the *QFP Carrier & Development Socket Data Sheet*.

MAX 7000S devices are not shipped in carriers.

Tables 19 through 26 show the MAX 7000 and MAX 7000E AC operating conditions.

Table 19. MAX 7000 & MAX 7000E External Timing Parameters *Note (1)*

Symbol	Parameter	Conditions	-6 Speed Grade		-7 Speed Grade		Unit

t_{ZX3}	Output buffer enable delay	C1 = 35 pF		9.0		9.0		9.0		9.0	ns
t_{XZ}	Output buffer disable delay	C1 = 5 pF		4.0		4.0		4.0		5.0	ns
t_{SU}	Register setup time		0.8		1.0		3.0		2.0		ns
t_{H}	Register hold time		1.7		2.0		2.0		3.0		ns

Table 32. EPM7128S Internal Timing Parameters *Note (1)*

Symbol	Parameter	Conditions	Speed Grade								Unit
			-6		-7		-10		-15		
			Min	Max	Min	Max	Min	Max	Min	Max	
t_{IN}	Input pad and buffer delay			0.2		0.5		0.5		2.0	ns
t_{IO}	I/O input pad and buffer delay			0.2		0.5		0.5		2.0	ns
t_{FIN}	Fast input delay			2.6		1.0		1.0		2.0	ns
t_{SEXP}	Shared expander delay			3.7		4.0		5.0		8.0	ns
t_{PEXP}	Parallel expander delay			1.1		0.8		0.8		1.0	ns
t_{LAD}	Logic array delay			3.0		3.0		5.0		6.0	ns
t_{LAC}	Logic control array delay			3.0		3.0		5.0		6.0	ns
t_{IOE}	Internal output enable delay			0.7		2.0		2.0		3.0	ns
t_{OD1}	Output buffer and pad delay	C1 = 35 pF		0.4		2.0		1.5		4.0	ns
t_{OD2}	Output buffer and pad delay	C1 = 35 pF *(6)*		0.9		2.5		2.0		5.0	ns
t_{OD3}	Output buffer and pad delay	C1 = 35 pF		5.4		7.0		5.5		8.0	ns
t_{ZX1}	Output buffer enable delay	C1 = 35 pF		4.0		4.0		5.0		6.0	ns
t_{ZX2}	Output buffer enable delay	C1 = 35 pF *(6)*		4.5		4.5		5.5		7.0	ns
t_{ZX3}	Output buffer enable delay	C1 = 35 pF		9.0		9.0		9.0		10.0	ns
t_{XZ}	Output buffer disable delay	C1 = 5 pF		4.0		4.0		5.0		6.0	ns
t_{SU}	Register setup time		1.0		3.0		2.0		4.0		ns
t_{H}	Register hold time		1.7		2.0		5.0		4.0		ns
t_{FSU}	Register setup time of fast input		1.9		3.0		3.0		2.0		ns
t_{FH}	Register hold time of fast input		0.6		0.5		0.5		1.0		ns
t_{RD}	Register delay			1.4		1.0		2.0		1.0	ns
t_{COMB}	Combinatorial delay			1.0		1.0		2.0		1.0	ns
t_{IC}	Array clock delay			3.1		3.0		5.0		6.0	ns
t_{EN}	Register enable time			3.0		3.0		5.0		6.0	ns
t_{GLOB}	Global control delay			2.0		1.0		1.0		1.0	ns
t_{PRE}	Register preset time			2.4		2.0		3.0		4.0	ns
t_{CLR}	Register clear time			2.4		2.0		3.0		4.0	ns
t_{PIA}	PIA delay	*(7)*		1.4		1.0		1.0		2.0	ns
t_{LPA}	Low-power adder	*(8)*		11.0		10.0		11.0		13.0	ns

Table 34. EPM7160S Internal Timing Parameters (Part 2 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade								Unit
			-6		-7		-10		-15		
			Min	Max	Min	Max	Min	Max	Min	Max	
t_{CLR}	Register clear time			2.4		3.0		3.0		4.0	ns
t_{PIA}	PIA delay	*(7)*		1.6		2.0		1.0		2.0	ns
t_{LPA}	Low-power adder	*(8)*		11.0		10.0		11.0		13.0	ns

Notes to tables:

(1) These values are specified under the recommended operating conditions shown in Table 14. See Figure 13 for more information on switching waveforms.
(2) This minimum pulse width for preset and clear applies for both global clear and array controls. The t_{LPA} parameter must be added to this minimum width if the clear or reset signal incorporates the t_{LAD} parameter into the signal path.
(3) This parameter is a guideline that is sample-tested only and is based on extensive device characterization. This parameter applies for both global and array clocking.
(4) These parameters are measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.
(5) The $\mathbf{f_{MAX}}$ values represent the highest frequency for pipelined data.
(6) Operating conditions: $V_{CCIO} = 3.3\ V \pm 10\%$ for commercial and industrial use.
(7) For EPM7064S-5, EPM7064S-6, EPM7128S-6, EPM7160S-6, EPM7160S-7, EPM7192S-7, and EPM7256S-7 devices, these values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.
(8) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{EN}, t_{SEXP}, $\mathbf{t_{ACL}}$, and $\mathbf{t_{CPPW}}$ parameters for macrocells running in the low-power mode.

Tables 35 and 36 show the EPM7192S AC operating conditions.

Table 35. EPM7192S External Timing Parameters (Part 1 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
$\mathbf{t_{PD1}}$	Input to non-registered output	C1 = 35 pF		7.5		10.0		15.0	ns
$\mathbf{t_{PD2}}$	I/O input to non-registered output	C1 = 35 pF		7.5		10.0		15.0	ns
$\mathbf{t_{SU}}$	Global clock setup time		4.1		7.0		11.0		ns
$\mathbf{t_{H}}$	Global clock hold time		0.0		0.0		0.0		ns
$\mathbf{t_{FSU}}$	Global clock setup time of fast input		3.0		3.0		3.0		ns
$\mathbf{t_{FH}}$	Global clock hold time of fast input		0.0		0.5		0.0		ns
$\mathbf{t_{CO1}}$	Global clock to output delay	C1 = 35 pF		4.7		5.0		8.0	ns
$\mathbf{t_{CH}}$	Global clock high time		3.0		4.0		5.0		ns
$\mathbf{t_{CL}}$	Global clock low time		3.0		4.0		5.0		ns
$\mathbf{t_{ASU}}$	Array clock setup time		1.0		2.0		4.0		ns

Table 36. EPM7192S Internal Timing Parameters (Part 2 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
t_H	Register hold time		1.7		3.0		4.0		ns
t_{FSU}	Register setup time of fast input		2.3		3.0		2.0		ns
t_{FH}	Register hold time of fast input		0.7		0.5		1.0		ns
t_{RD}	Register delay			1.4		2.0		1.0	ns
t_{COMB}	Combinatorial delay			1.2		2.0		1.0	ns
t_{IC}	Array clock delay			3.2		5.0		6.0	ns
t_{EN}	Register enable time			3.1		5.0		6.0	ns
t_{GLOB}	Global control delay			2.5		1.0		1.0	ns
t_{PRE}	Register preset time			2.7		3.0		4.0	ns
t_{CLR}	Register clear time			2.7		3.0		4.0	ns
t_{PIA}	PIA delay	*(7)*		2.4		1.0		2.0	ns
t_{LPA}	Low-power adder	*(8)*		10.0		11.0		13.0	ns

Notes to tables:

(1) These values are specified under the recommended operating conditions shown in Table 14. See Figure 13 for more information on switching waveforms.

(2) This minimum pulse width for preset and clear applies for both global clear and array controls. The t_{LPA} parameter must be added to this minimum width if the clear or reset signal incorporates the t_{LAD} parameter into the signal path.

(3) This parameter is a guideline that is sample-tested only and is based on extensive device characterization. This parameter applies for both global and array clocking.

(4) These parameters are measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.

(5) The $\mathbf{f_{MAX}}$ values represent the highest frequency for pipelined data.

(6) Operating conditions: $V_{CCIO} = 3.3\ V \pm 10\%$ for commercial and industrial use.

(7) For EPM7064S-5, EPM7064S-6, EPM7128S-6, EPM7160S-6, EPM7160S-7, EPM7192S-7, and EPM7256S-7 devices, these values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.

(8) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{EN}, t_{SEXP}, $\mathbf{t_{ACL}}$, and $\mathbf{t_{CPPW}}$ parameters for macrocells running in the low-power mode.

Revision History

The information contained in the *MAX 7000 Programmable Logic Device Family Data Sheet* version 6.7 supersedes information published in previous versions. The following changes were made in the *MAX 7000 Programmable Logic Device Family Data Sheet* version 6.7:

Version 6.7

The following changes were made in the *MAX 7000 Programmable Logic Device Family Data Sheet* version 6.7:

- Reference to *AN 88: Using the Jam Language for ISP & ICR via an Embedded Processor* has been replaced by *AN 122: Using Jam STAPL for ISP & ICR via an Embedded Processor*.

Version 6.6

The following changes were made in the *MAX 7000 Programmable Logic Device Family Data Sheet* version 6.6:

- Added Tables 6 through 8.
- Added "Programming Sequence" section on page 17 and "Programming Times" section on page 18.

Version 6.5

The following changes were made in the *MAX 7000 Programmable Logic Device Family Data Sheet* version 6.5:

- Updated text on page 16.

Version 6.4

The following changes were made in the *MAX 7000 Programmable Logic Device Family Data Sheet* version 6.4:

- Added *Note (5)* on page 28.

Version 6.3

The following changes were made in the *MAX 7000 Programmable Logic Device Family Data Sheet* version 6.3:

- Updated the "Open-Drain Output Option (MAX 7000S Devices Only)" section on page 20.
