### Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

### Applications of Embedded - CPLDs

#### Details

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	5 ns
Voltage Supply - Internal	4.75V ~ 5.25V
Number of Logic Elements/Blocks	4
Number of Macrocells	64
Number of Gates	1250
Number of I/O	36
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-TQFP
Supplier Device Package	44-TQFP (10x10)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/intel/epm7064stc44-5f">https://www.e-xfl.com/product-detail/intel/epm7064stc44-5f</a>

- Additional design entry and simulation support provided by EDIF 2.0.0 and 3.0.0 netlist files, library of parameterized modules (LPM), Verilog HDL, VHDL, and other interfaces to popular EDA tools from manufacturers such as Cadence, Exemplar Logic, Mentor Graphics, OrCAD, Synopsys, and VeriBest
- Programming support
  - Altera’s Master Programming Unit (MPU) and programming hardware from third-party manufacturers program all MAX 7000 devices
  - The BitBlaster™ serial download cable, ByteBlasterMV™ parallel port download cable, and MasterBlaster™ serial/universal serial bus (USB) download cable program MAX 7000S devices

## General Description

The MAX 7000 family of high-density, high-performance PLDs is based on Altera’s second-generation MAX architecture. Fabricated with advanced CMOS technology, the EEPROM-based MAX 7000 family provides 600 to 5,000 usable gates, ISP, pin-to-pin delays as fast as 5 ns, and counter speeds of up to 175.4 MHz. MAX 7000S devices in the -5, -6, -7, and -10 speed grades as well as MAX 7000 and MAX 7000E devices in -5, -6, -7, -10P, and -12P speed grades comply with the PCI Special Interest Group (PCI SIG) *PCI Local Bus Specification, Revision 2.2*. See [Table 3](#) for available speed grades.

**Table 3. MAX 7000 Speed Grades**

The MAX 7000 architecture supports 100% TTL emulation and high-density integration of SSI, MSI, and LSI logic functions. The MAX 7000 architecture easily integrates multiple devices ranging from PALs, GALs, and 22V10s to MACH and pLSI devices. MAX 7000 devices are available in a wide range of packages, including PLCC, PGA, PQFP, RQFP, and TQFP packages. See [Table 5](#).

**Notes:**

- (1) When the JTAG interface in MAX 7000S devices is used for either boundary-scan testing or for ISP, four I/O pins become JTAG pins.
- (2) Perform a complete thermal analysis before committing a design to this device package. For more information, see the [Operating Requirements for Altera Devices Data Sheet](#).

MAX 7000 devices use CMOS EEPROM cells to implement logic functions. The user-configurable MAX 7000 architecture accommodates a variety of independent combinatorial and sequential logic functions. The devices can be reprogrammed for quick and efficient iterations during design development and debug cycles, and can be programmed and erased up to 100 times.

MAX 7000 devices contain from 32 to 256 macrocells that are combined into groups of 16 macrocells, called logic array blocks (LABs). Each macrocell has a programmable-AND/fixed-OR array and a configurable register with independently programmable clock, clock enable, clear, and preset functions. To build complex logic functions, each macrocell can be supplemented with both shareable expander product terms and high-speed parallel expander product terms to provide up to 32 product terms per macrocell.

The MAX 7000 family provides programmable speed/power optimization. Speed-critical portions of a design can run at high speed/full power, while the remaining portions run at reduced speed/low power. This speed/power optimization feature enables the designer to configure one or more macrocells to operate at 50% or lower power while adding only a nominal timing delay. MAX 7000E and MAX 7000S devices also provide an option that reduces the slew rate of the output buffers, minimizing noise transients when non-speed-critical signals are switching. The output drivers of all MAX 7000 devices (except 44-pin devices) can be set for either 3.3-V or 5.0-V operation, allowing MAX 7000 devices to be used in mixed-voltage systems.

The MAX 7000 family is supported by Altera development systems, which are integrated packages that offer schematic, text—including VHDL, Verilog HDL, and the Altera Hardware Description Language (AHDL)—and waveform design entry, compilation and logic synthesis, simulation and timing analysis, and device programming. The software provides EDIF 2.0.0 and 3.0.0, LPM, VHDL, Verilog HDL, and other interfaces for additional design entry and simulation support from other industry-standard PC- and UNIX-workstation-based EDA tools. The software runs on Windows-based PCs, as well as Sun SPARCstation, and HP 9000 Series 700/800 workstations.

For more information on development tools, see the [MAX+PLUS II Programmable Logic Development System & Software Data Sheet](#) and the [Quartus Programmable Logic Development System & Software Data Sheet](#).

## Functional Description

The MAX 7000 architecture includes the following elements:

- Logic array blocks
- Macrocells
- Expander product terms (shareable and parallel)
- Programmable interconnect array
- I/O control blocks

The MAX 7000 architecture includes four dedicated inputs that can be used as general-purpose inputs or as high-speed, global control signals (clock, clear, and two output enable signals) for each macrocell and I/O pin. Figure 1 shows the architecture of EPM7032, EPM7064, and EPM7096 devices.

Figure 1. EPM7032, EPM7064 & EPM7096 Device Block Diagram

The compiler can allocate up to three sets of up to five parallel expanders automatically to the macrocells that require additional product terms. Each set of five parallel expanders incurs a small, incremental timing delay ( $t_{PEXP}$ ). For example, if a macrocell requires 14 product terms, the Compiler uses the five dedicated product terms within the macrocell and allocates two sets of parallel expanders; the first set includes five product terms and the second set includes four product terms, increasing the total delay by  $2 \times t_{PEXP}$ .

Two groups of 8 macrocells within each LAB (e.g., macrocells 1 through 8 and 9 through 16) form two chains to lend or borrow parallel expanders. A macrocell borrows parallel expanders from lower-numbered macrocells. For example, macrocell 8 can borrow parallel expanders from macrocell 7, from macrocells 7 and 6, or from macrocells 7, 6, and 5. Within each group of 8, the lowest-numbered macrocell can only lend parallel expanders and the highest-numbered macrocell can only borrow them. Figure 6 shows how parallel expanders can be borrowed from a neighboring macrocell.

**Figure 6. Parallel Expanders**

*Unused product terms in a macrocell can be allocated to a neighboring macrocell.*

## Programmable Interconnect Array

Logic is routed between LABs via the programmable interconnect array (PIA). This global bus is a programmable path that connects any signal source to any destination on the device. All MAX 7000 dedicated inputs, I/O pins, and macrocell outputs feed the PIA, which makes the signals available throughout the entire device. Only the signals required by each LAB are actually routed from the PIA into the LAB. Figure 7 shows how the PIA signals are routed into the LAB. An EEPROM cell controls one input to a 2-input AND gate, which selects a PIA signal to drive into the LAB.

**Figure 7. PIA Routing**

While the routing delays of channel-based routing schemes in masked or FPGAs are cumulative, variable, and path-dependent, the MAX 7000 PIA has a fixed delay. The PIA thus eliminates skew between signals and makes timing performance easy to predict.

## I/O Control Blocks

The I/O control block allows each I/O pin to be individually configured for input, output, or bidirectional operation. All I/O pins have a tri-state buffer that is individually controlled by one of the global output enable signals or directly connected to ground or  $V_{CC}$ . Figure 8 shows the I/O control block for the MAX 7000 family. The I/O control block of EPM7032, EPM7064, and EPM7096 devices has two global output enable signals that are driven by two dedicated active-low output enable pins (OE1 and OE2). The I/O control block of MAX 7000E and MAX 7000S devices has six global output enable signals that are driven by the true or complement of two output enable signals, a subset of the I/O pins, or a subset of the I/O macrocells.

When the tri-state buffer control is connected to ground, the output is tri-stated (high impedance) and the I/O pin can be used as a dedicated input. When the tri-state buffer control is connected to  $V_{CC}$ , the output is enabled.

The MAX 7000 architecture provides dual I/O feedback, in which macrocell and pin feedbacks are independent. When an I/O pin is configured as an input, the associated macrocell can be used for buried logic.

### In-System Programmability (ISP)

MAX 7000S devices are in-system programmable via an industry-standard 4-pin Joint Test Action Group (JTAG) interface (IEEE Std. 1149.1-1990). ISP allows quick, efficient iterations during design development and debugging cycles. The MAX 7000S architecture internally generates the high programming voltage required to program EEPROM cells, allowing in-system programming with only a single 5.0 V power supply. During in-system programming, the I/O pins are tri-stated and pulled-up to eliminate board conflicts. The pull-up value is nominally 50 k $\Omega$ .

ISP simplifies the manufacturing flow by allowing devices to be mounted on a printed circuit board with standard in-circuit test equipment before they are programmed. MAX 7000S devices can be programmed by downloading the information via in-circuit testers (ICT), embedded processors, or the Altera MasterBlaster, ByteBlasterMV, ByteBlaster, BitBlaster download cables. (The ByteBlaster cable is obsolete and is replaced by the ByteBlasterMV cable, which can program and configure 2.5-V, 3.3-V, and 5.0-V devices.) Programming the devices after they are placed on the board eliminates lead damage on high-pin-count packages (e.g., QFP packages) due to device handling and allows devices to be reprogrammed after a system has already shipped to the field. For example, product upgrades can be performed in the field via software or modem.

In-system programming can be accomplished with either an adaptive or constant algorithm. An adaptive algorithm reads information from the unit and adapts subsequent programming steps to achieve the fastest possible programming time for that unit. Because some in-circuit testers cannot support an adaptive algorithm, Altera offers devices tested with a constant algorithm. Devices tested to the constant algorithm have an "F" suffix in the ordering code.

The Jam™ Standard Test and Programming Language (STAPL) can be used to program MAX 7000S devices with in-circuit testers, PCs, or embedded processor.

For more information on using the Jam language, refer to *AN 122: Using Jam STAPL for ISP & ICR via an Embedded Processor*.

The ISP circuitry in MAX 7000S devices is compatible with IEEE Std. 1532 specification. The IEEE Std. 1532 is a standard developed to allow concurrent ISP between multiple PLD vendors.

## Programming Sequence

During in-system programming, instructions, addresses, and data are shifted into the MAX 7000S device through the TDI input pin. Data is shifted out through the TDO output pin and compared against the expected data.

Programming a pattern into the device requires the following six ISP stages. A stand-alone verification of a programmed pattern involves only stages 1, 2, 5, and 6.

1. *Enter ISP.* The enter ISP stage ensures that the I/O pins transition smoothly from user mode to ISP mode. The enter ISP stage requires 1 ms.
2. *Check ID.* Before any program or verify process, the silicon ID is checked. The time required to read this silicon ID is relatively small compared to the overall programming time.
3. *Bulk Erase.* Erasing the device in-system involves shifting in the instructions to erase the device and applying one erase pulse of 100 ms.
4. *Program.* Programming the device in-system involves shifting in the address and data and then applying the programming pulse to program the EEPROM cells. This process is repeated for each EEPROM address.
5. *Verify.* Verifying an Altera device in-system involves shifting in addresses, applying the read pulse to verify the EEPROM cells, and shifting out the data for comparison. This process is repeated for each EEPROM address.
6. *Exit ISP.* An exit ISP stage ensures that the I/O pins transition smoothly from ISP mode to user mode. The exit ISP stage requires 1 ms.

## Programming Times

The time required to implement each of the six programming stages can be broken into the following two elements:

- A pulse time to erase, program, or read the EEPROM cells.
- A shifting time based on the test clock (TCK) frequency and the number of TCK cycles to shift instructions, address, and data into the device.

By combining the pulse and shift times for each of the programming stages, the program or verify time can be derived as a function of the TCK frequency, the number of devices, and specific target device(s). Because different ISP-capable devices have a different number of EEPROM cells, both the total fixed and total variable times are unique for a single device.

### *Programming a Single MAX 7000S Device*

The time required to program a single MAX 7000S device in-system can be calculated from the following formula:

$$t_{PROG} = t_{PPULSE} + \frac{Cycle_{PTCK}}{f_{TCK}}$$

where:  $t_{PROG}$  = Programming time  
 $t_{PPULSE}$  = Sum of the fixed times to erase, program, and verify the EEPROM cells  
 $Cycle_{PTCK}$  = Number of TCK cycles to program a device  
 $f_{TCK}$  = TCK frequency

The ISP times for a stand-alone verification of a single MAX 7000S device can be calculated from the following formula:

$$t_{VER} = t_{VPULSE} + \frac{Cycle_{VTCK}}{f_{TCK}}$$

where:  $t_{VER}$  = Verify time  
 $t_{VPULSE}$  = Sum of the fixed times to verify the EEPROM cells  
 $Cycle_{VTCK}$  = Number of TCK cycles to verify a device

Figure 12. MAX 7000 Timing Model

Notes:

- (1) Only available in MAX 7000E and MAX 7000S devices.
- (2) Not available in 44-pin devices.

The timing characteristics of any signal path can be derived from the timing model and parameters of a particular device. External timing parameters, which represent pin-to-pin timing delays, can be calculated as the sum of internal parameters. Figure 13 shows the internal timing relationship of internal and external delay parameters.

For more information, see [Application Note 94 \(Understanding MAX 7000 Timing\)](#).

**Notes to tables:**

- (1) These values are specified under the recommended operating conditions shown in Table 14. See Figure 13 for more information on switching waveforms.
- (2) This minimum pulse width for preset and clear applies for both global clear and array controls. The  $t_{LPA}$  parameter must be added to this minimum width if the clear or reset signal incorporates the  $t_{LAD}$  parameter into the signal path.
- (3) This parameter is a guideline that is sample-tested only and is based on extensive device characterization. This parameter applies for both global and array clocking.
- (4) These parameters are measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.
- (5) The  $f_{MAX}$  values represent the highest frequency for pipelined data.
- (6) Operating conditions:  $V_{CCIO} = 3.3\text{ V} \pm 10\%$  for commercial and industrial use.
- (7) For EPM7064S-5, EPM7064S-6, EPM7128S-6, EPM7160S-6, EPM7160S-7, EPM7192S-7, and EPM7256S-7 devices, these values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.
- (8) The  $t_{LPA}$  parameter must be added to the  $t_{LAD}$ ,  $t_{LAC}$ ,  $t_{IC}$ ,  $t_{EN}$ ,  $t_{SEXP}$ ,  $t_{ACL}$  and  $t_{CPPW}$  parameters for macrocells running in the low-power mode.

Tables 31 and 32 show the EPM7128S AC operating conditions.

$t_{ACL}$	Array clock low time		3.0		3.0		4.0		6.0		ns
$t_{CPPW}$	Minimum pulse width for clear and preset	(2)	3.0		3.0		4.0		6.0		ns
$t_{ODH}$	Output data hold time after clock	C1 = 35 pF (3)	1.0		1.0		1.0		1.0		ns
$t_{CNT}$	Minimum global clock period			6.8		8.0		10.0		13.0	ns
$f_{CNT}$	Maximum internal global clock frequency	(4)	147.1		125.0		100.0		76.9		MHz
$t_{ACNT}$	Minimum array clock period			6.8		8.0		10.0		13.0	ns
$f_{ACNT}$	Maximum internal array clock frequency	(4)	147.1		125.0		100.0		76.9		MHz
$f_{MAX}$	Maximum clock frequency	(5)	166.7		166.7		125.0		100.0		MHz

Table 35. EPM7192S External Timing Parameters (Part 2 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
$t_{AH}$	Array clock hold time		1.8		3.0		4.0		ns
$t_{ACO1}$	Array clock to output delay	C1 = 35 pF		7.8		10.0		15.0	ns
$t_{ACH}$	Array clock high time		3.0		4.0		6.0		ns
$t_{ACL}$	Array clock low time		3.0		4.0		6.0		ns
$t_{CPPW}$	Minimum pulse width for clear and preset	(2)	3.0		4.0		6.0		ns
$t_{ODH}$	Output data hold time after clock	C1 = 35 pF (3)	1.0		1.0		1.0		ns
$t_{CNT}$	Minimum global clock period			8.0		10.0		13.0	ns
$f_{CNT}$	Maximum internal global clock frequency	(4)	125.0		100.0		76.9		MHz
$t_{ACNT}$	Minimum array clock period			8.0		10.0		13.0	ns
$f_{ACNT}$	Maximum internal array clock frequency	(4)	125.0		100.0		76.9		MHz
$f_{MAX}$	Maximum clock frequency	(5)	166.7		125.0		100.0		MHz

Table 36. EPM7192S Internal Timing Parameters (Part 1 of 2) *Note (1)*

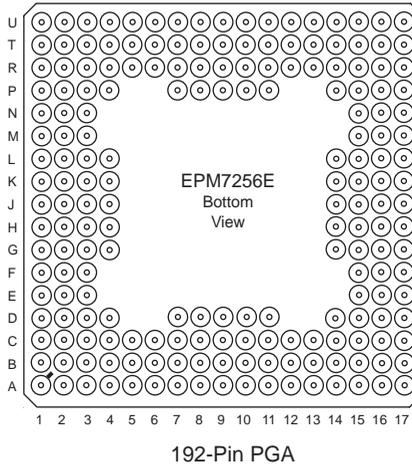

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
$t_{IN}$	Input pad and buffer delay			0.3		0.5		2.0	ns
$t_{IO}$	I/O input pad and buffer delay			0.3		0.5		2.0	ns
$t_{FIN}$	Fast input delay			3.2		1.0		2.0	ns
$t_{SEXP}$	Shared expander delay			4.2		5.0		8.0	ns
$t_{PEXP}$	Parallel expander delay			1.2		0.8		1.0	ns
$t_{LAD}$	Logic array delay			3.1		5.0		6.0	ns
$t_{LAC}$	Logic control array delay			3.1		5.0		6.0	ns
$t_{IOE}$	Internal output enable delay			0.9		2.0		3.0	ns
$t_{OD1}$	Output buffer and pad delay	C1 = 35 pF		0.5		1.5		4.0	ns
$t_{OD2}$	Output buffer and pad delay	C1 = 35 pF (6)		1.0		2.0		5.0	ns
$t_{OD3}$	Output buffer and pad delay	C1 = 35 pF		5.5		5.5		7.0	ns
$t_{ZX1}$	Output buffer enable delay	C1 = 35 pF		4.0		5.0		6.0	ns
$t_{ZX2}$	Output buffer enable delay	C1 = 35 pF (6)		4.5		5.5		7.0	ns
$t_{ZX3}$	Output buffer enable delay	C1 = 35 pF		9.0		9.0		10.0	ns
$t_{XZ}$	Output buffer disable delay	C1 = 5 pF		4.0		5.0		6.0	ns
$t_{SU}$	Register setup time		1.1		2.0		4.0		ns

Tables 37 and 38 show the EPM7256S AC operating conditions.

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
$t_{PD1}$	Input to non-registered output	C1 = 35 pF		7.5		10.0		15.0	ns
$t_{PD2}$	I/O input to non-registered output	C1 = 35 pF		7.5		10.0		15.0	ns
$t_{SU}$	Global clock setup time		3.9		7.0		11.0		ns
$t_H$	Global clock hold time		0.0		0.0		0.0		ns
$t_{FSU}$	Global clock setup time of fast input		3.0		3.0		3.0		ns
$t_{FH}$	Global clock hold time of fast input		0.0		0.5		0.0		ns
$t_{CO1}$	Global clock to output delay	C1 = 35 pF		4.7		5.0		8.0	ns
$t_{CH}$	Global clock high time		3.0		4.0		5.0		ns
$t_{CL}$	Global clock low time		3.0		4.0		5.0		ns
$t_{ASU}$	Array clock setup time		0.8		2.0		4.0		ns
$t_{AH}$	Array clock hold time		1.9		3.0		4.0		ns
$t_{ACO1}$	Array clock to output delay	C1 = 35 pF		7.8		10.0		15.0	ns
$t_{ACH}$	Array clock high time		3.0		4.0		6.0		ns
$t_{ACL}$	Array clock low time		3.0		4.0		6.0		ns
$t_{CPW}$	Minimum pulse width for clear and preset	(2)	3.0		4.0		6.0		ns
$t_{ODH}$	Output data hold time after clock	C1 = 35 pF (3)	1.0		1.0		1.0		ns
$t_{CNT}$	Minimum global clock period			7.8		10.0		13.0	ns
$f_{CNT}$	Maximum internal global clock frequency	(4)	128.2		100.0		76.9		MHz
$t_{ACNT}$	Minimum array clock period			7.8		10.0		13.0	ns
$f_{ACNT}$	Maximum internal array clock frequency	(4)	128.2		100.0		76.9		MHz
$f_{MAX}$	Maximum clock frequency	(5)	166.7		125.0		100.0		MHz
