Welcome to E-XFL.COM

Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Active
Programmable Type	EE PLD
Delay Time tpd(1) Max	20 ns
Voltage Supply - Internal	4.75V ~ 5.25V
Number of Logic Elements/Blocks	16
Number of Macrocells	256
Number of Gates	5000
Number of I/O	164
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	208-BFQFP Exposed Pad
Supplier Device Package	208-RQFP (28x28)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=epm7256erc208-20

Table 2. MAX 7000S Device Features

Feature	EPM7032S	EPM7064S	EPM7128S	EPM7160S	EPM7192S	EPM7256S
Usable gates	600	1,250	2,500	3,200	3,750	5,000
Macrocells	32	64	128	160	192	256
Logic array blocks	2	4	8	10	12	16
Maximum user I/O pins	36	68	100	104	124	164
t_{PD} (ns)	5	5	6	6	7.5	7.5
t_{SU} (ns)	2.9	2.9	3.4	3.4	4.1	3.9
t_{FSU} (ns)	2.5	2.5	2.5	2.5	3	3
t_{CO1} (ns)	3.2	3.2	4	3.9	4.7	4.7
f_{CNT} (MHz)	175.4	175.4	147.1	149.3	125.0	128.2

…and More Features

- Open-drain output option in MAX 7000S devices
- Programmable macrocell flipflops with individual clear, preset, clock, and clock enable controls
- Programmable power-saving mode for a reduction of over 50% in each macrocell
- Configurable expander product-term distribution, allowing up to 32 product terms per macrocell
- 44 to 208 pins available in plastic J-lead chip carrier (PLCC), ceramic pin-grid array (PGA), plastic quad flat pack (PQFP), power quad flat pack (RQFP), and 1.0-mm thin quad flat pack (TQFP) packages
- Programmable security bit for protection of proprietary designs
- 3.3-V or 5.0-V operation
  - MultiVolt™ I/O interface operation, allowing devices to interface with 3.3-V or 5.0-V devices (MultiVolt I/O operation is not available in 44-pin packages)
  - Pin compatible with low-voltage MAX 7000A and MAX 7000B devices
- Enhanced features available in MAX 7000E and MAX 7000S devices
  - Six pin- or logic-driven output enable signals
  - Two global clock signals with optional inversion
  - Enhanced interconnect resources for improved routability
  - Fast input setup times provided by a dedicated path from I/O pin to macrocell registers
  - Programmable output slew-rate control
- Software design support and automatic place-and-route provided by Altera's development system for Windows-based PCs and Sun SPARCstation, and HP 9000 Series 700/800 workstations

The MAX 7000 architecture supports 100% TTL emulation and high-density integration of SSI, MSI, and LSI logic functions. The MAX 7000 architecture easily integrates multiple devices ranging from PALs, GALs, and 22V10s to MACH and pLSI devices. MAX 7000 devices are available in a wide range of packages, including PLCC, PGA, PQFP, RQFP, and TQFP packages. See Table 5.

Table 5. MAX 7000 Maximum User I/O Pins *Note (1)*

Device	44-Pin PLCC	44-Pin PQFP	44-Pin TQFP	68-Pin PLCC	84-Pin PLCC	100-Pin PQFP	100-Pin TQFP	160-Pin PQFP	160-Pin PGA	192-Pin PGA	208-Pin PQFP	208-Pin RQFP

EPM7256E								132 *(2)*		164		164
EPM7256S											164 *(2)*	164

Notes:

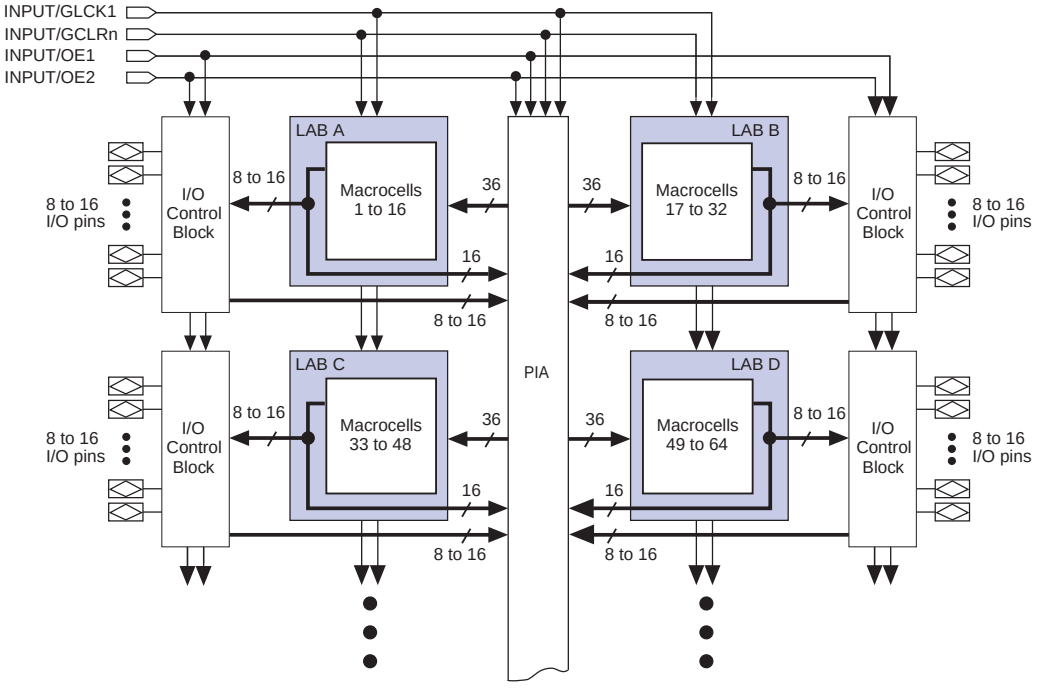
(1) When the JTAG interface in MAX 7000S devices is used for either boundary-scan testing or for ISP, four I/O pins become JTAG pins.

(2) Perform a complete thermal analysis before committing a design to this device package. For more information, see the *Operating Requirements for Altera Devices Data Sheet*.

MAX 7000 devices use CMOS EEPROM cells to implement logic functions. The user-configurable MAX 7000 architecture accommodates a variety of independent combinatorial and sequential logic functions. The devices can be reprogrammed for quick and efficient iterations during design development and debug cycles, and can be programmed and erased up to 100 times.

The MAX 7000 architecture includes four dedicated inputs that can be used as general-purpose inputs or as high-speed, global control signals (clock, clear, and two output enable signals) for each macrocell and I/O pin. Figure 1 shows the architecture of EPM7032, EPM7064, and EPM7096 devices.

Figure 1. EPM7032, EPM7064 & EPM7096 Device Block Diagram

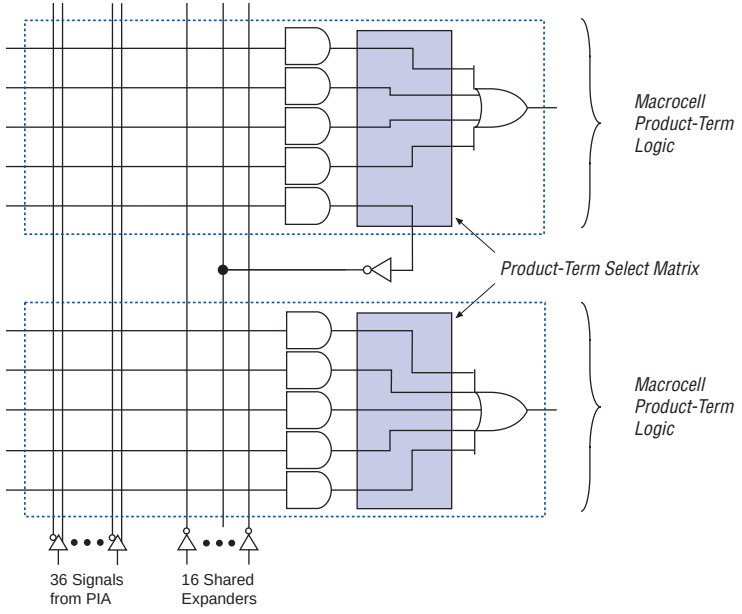


Shareable Expanders

Each LAB has 16 shareable expanders that can be viewed as a pool of uncommitted single product terms (one from each macrocell) with inverted outputs that feed back into the logic array. Each shareable expander can be used and shared by any or all macrocells in the LAB to build complex logic functions. A small delay (t_{SEXP}) is incurred when shareable expanders are used. Figure 5 shows how shareable expanders can feed multiple macrocells.

Figure 5. Shareable Expanders

Shareable expanders can be shared by any or all macrocells in an LAB.



Parallel Expanders

Parallel expanders are unused product terms that can be allocated to a neighboring macrocell to implement fast, complex logic functions. Parallel expanders allow up to 20 product terms to directly feed the macrocell OR logic, with five product terms provided by the macrocell and 15 parallel expanders provided by neighboring macrocells in the LAB.

When the tri-state buffer control is connected to ground, the output is tri-stated (high impedance) and the I/O pin can be used as a dedicated input. When the tri-state buffer control is connected to V_{CC}, the output is enabled.

The MAX 7000 architecture provides dual I/O feedback, in which macrocell and pin feedbacks are independent. When an I/O pin is configured as an input, the associated macrocell can be used for buried logic.

In-System Programmability (ISP)

MAX 7000S devices are in-system programmable via an industry-standard 4-pin Joint Test Action Group (JTAG) interface (IEEE Std. 1149.1-1990). ISP allows quick, efficient iterations during design development and debugging cycles. The MAX 7000S architecture internally generates the high programming voltage required to program EEPROM cells, allowing in-system programming with only a single 5.0 V power supply. During in-system programming, the I/O pins are tri-stated and pulled-up to eliminate board conflicts. The pull-up value is nominally 50 k¾.

ISP simplifies the manufacturing flow by allowing devices to be mounted on a printed circuit board with standard in-circuit test equipment before they are programmed. MAX 7000S devices can be programmed by downloading the information via in-circuit testers (ICT), embedded processors, or the Altera MasterBlaster, ByteBlasterMV, ByteBlaster, BitBlaster download cables. (The ByteBlaster cable is obsolete and is replaced by the ByteBlasterMV cable, which can program and configure 2.5-V, 3.3-V, and 5.0-V devices.) Programming the devices after they are placed on the board eliminates lead damage on high-pin-count packages (e.g., QFP packages) due to device handling and allows devices to be reprogrammed after a system has already shipped to the field. For example, product upgrades can be performed in the field via software or modem.

In-system programming can be accomplished with either an adaptive or constant algorithm. An adaptive algorithm reads information from the unit and adapts subsequent programming steps to achieve the fastest possible programming time for that unit. Because some in-circuit testers cannot support an adaptive algorithm, Altera offers devices tested with a constant algorithm. Devices tested to the constant algorithm have an "F" suffix in the ordering code.

The Jam™ Standard Test and Programming Language (STAPL) can be used to program MAX 7000S devices with in-circuit testers, PCs, or embedded processor.

For more information on using the Jam language, refer to *AN 122: Using Jam STAPL for ISP & ICR via an Embedded Processor*.

The ISP circuitry in MAX 7000S devices is compatible with IEEE Std. 1532 specification. The IEEE Std. 1532 is a standard developed to allow concurrent ISP between multiple PLD vendors.

Programming Sequence

During in-system programming, instructions, addresses, and data are shifted into the MAX 7000S device through the `TDI` input pin. Data is shifted out through the `TDO` output pin and compared against the expected data.

Programming a pattern into the device requires the following six ISP stages. A stand-alone verification of a programmed pattern involves only stages 1, 2, 5, and 6.

1. *Enter ISP*. The enter ISP stage ensures that the I/O pins transition smoothly from user mode to ISP mode. The enter ISP stage requires 1 ms.

2. *Check ID*. Before any program or verify process, the silicon ID is checked. The time required to read this silicon ID is relatively small compared to the overall programming time.

3. *Bulk Erase*. Erasing the device in-system involves shifting in the instructions to erase the device and applying one erase pulse of 100 ms.

4. *Program*. Programming the device in-system involves shifting in the address and data and then applying the programming pulse to program the EEPROM cells. This process is repeated for each EEPROM address.

5. *Verify*. Verifying an Altera device in-system involves shifting in addresses, applying the read pulse to verify the EEPROM cells, and shifting out the data for comparison. This process is repeated for each EEPROM address.

6. *Exit ISP*. An exit ISP stage ensures that the I/O pins transition smoothly from ISP mode to user mode. The exit ISP stage requires 1 ms.

The instruction register length of MAX 7000S devices is 10 bits. Tables 10 and 11 show the boundary-scan register length and device IDCODE information for MAX 7000S devices.

Table 10. MAX 7000S Boundary-Scan Register Length

Device	Boundary-Scan Register Length
EPM7032S	1 *(1)*
EPM7064S	1 *(1)*
EPM7128S	288
EPM7160S	312
EPM7192S	360
EPM7256S	480

Note:
(1) This device does not support JTAG boundary-scan testing. Selecting either the EXTEST or SAMPLE/PRELOAD instruction will select the one-bit bypass register.

Table 11. 32-Bit MAX 7000 Device IDCODE *Note (1)*

Device	IDCODE (32 Bits)			
	Version (4 Bits)	Part Number (16 Bits)	Manufacturer's Identity (11 Bits)	1 (1 Bit) *(2)*
EPM7032S	0000	0111 0000 0011 0010	00001101110	1
EPM7064S	0000	0111 0000 0110 0100	00001101110	1
EPM7128S	0000	0111 0001 0010 1000	00001101110	1
EPM7160S	0000	0111 0001 0110 0000	00001101110	1
EPM7192S	0000	0111 0001 1001 0010	00001101110	1
EPM7256S	0000	0111 0010 0101 0110	00001101110	1

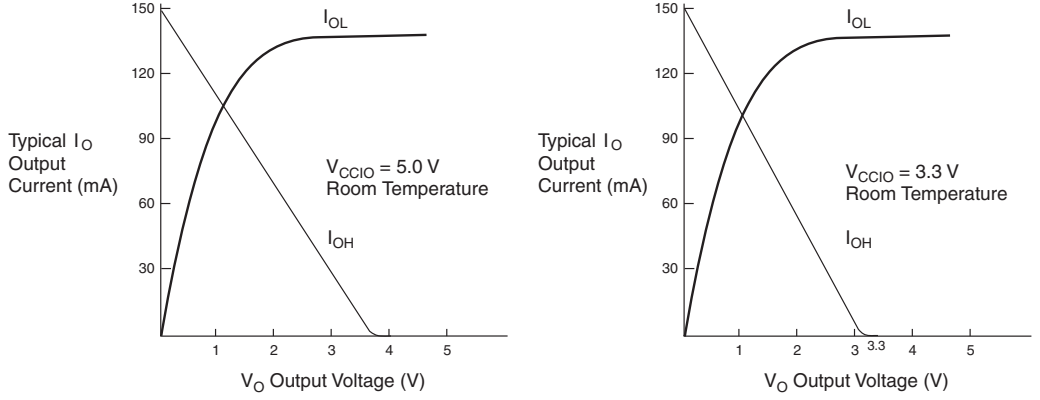
Notes:
(1) The most significant bit (MSB) is on the left.
(2) The least significant bit (LSB) for all JTAG IDCODEs is 1.

Notes to tables:

(1) See the *Operating Requirements for Altera Devices Data Sheet*.
(2) Minimum DC input voltage on I/O pins is –0.5 V and on 4 dedicated input pins is –0.3 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to 7.0 V for input currents less than 100 mA and periods shorter than 20 ns.
(3) Numbers in parentheses are for industrial-temperature-range devices.
(4) V_{CC} must rise monotonically.
(5) The POR time for all 7000S devices does not exceed 300 µs. The sufficient V_{CCINT} voltage level for POR is 4.5 V. The device is fully initialized within the POR time after V_{CCINT} reaches the sufficient POR voltage level.
(6) 3.3-V I/O operation is not available for 44-pin packages.
(7) The V_{CCISP} parameter applies only to MAX 7000S devices.
(8) During in-system programming, the minimum DC input voltage is –0.3 V.
(9) These values are specified under the MAX 7000 recommended operating conditions in Table 14 on page 26.
(10) The parameter is measured with 50% of the outputs each sourcing the specified current. The I_{OH} parameter refers to high-level TTL or CMOS output current.
(11) The parameter is measured with 50% of the outputs each sinking the specified current. The I_{OL} parameter refers to low-level TTL, PCI, or CMOS output current.
(12) When the JTAG interface is enabled in MAX 7000S devices, the input leakage current on the JTAG pins is typically –60 µA.
(13) Capacitance is measured at 25° C and is sample-tested only. The `OE1` pin has a maximum capacitance of 20 pF.

Figure 11 shows the typical output drive characteristics of MAX 7000 devices.

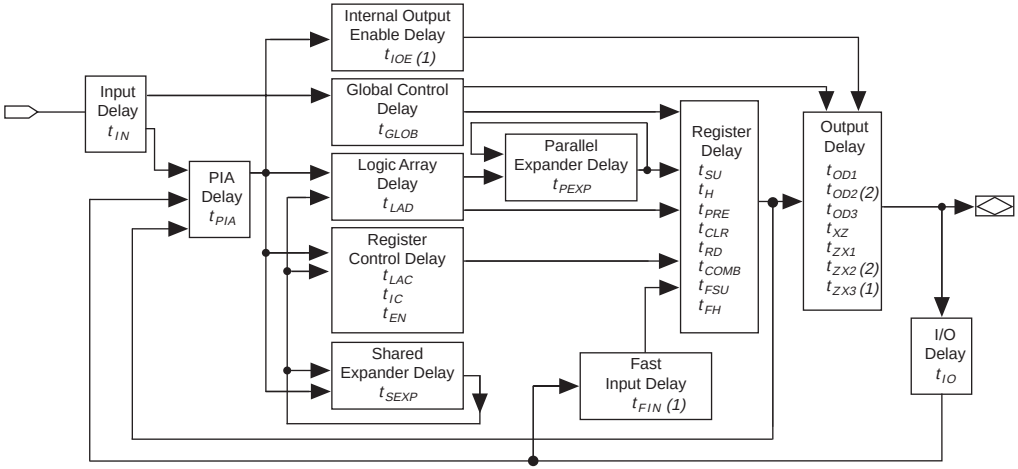
Figure 11. Output Drive Characteristics of 5.0-V MAX 7000 Devices



Timing Model

MAX 7000 device timing can be analyzed with the Altera software, with a variety of popular industry-standard EDA simulators and timing analyzers, or with the timing model shown in Figure 12. MAX 7000 devices have fixed internal delays that enable the designer to determine the worst-case timing of any design. The Altera software provides timing simulation, point-to-point delay prediction, and detailed timing analysis for a device-wide performance evaluation.

Figure 12. MAX 7000 Timing Model



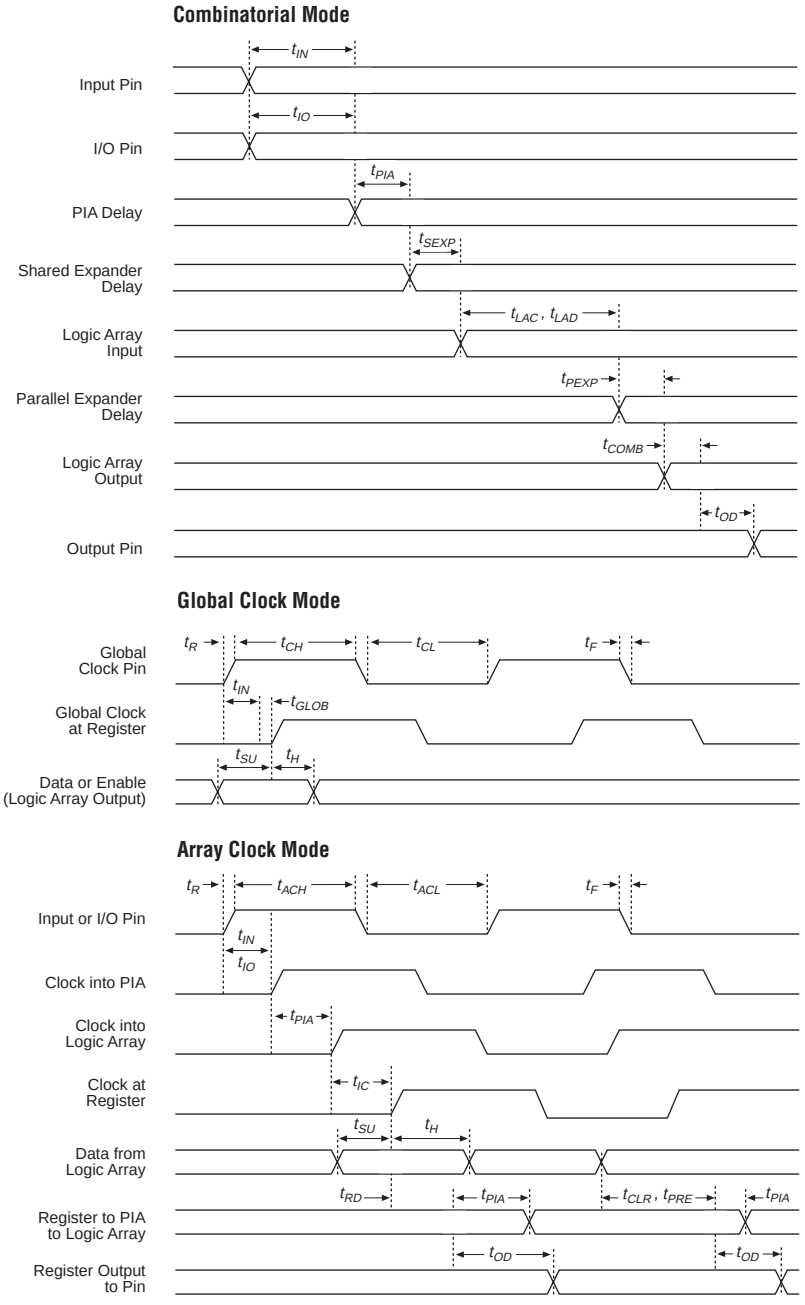
Notes:
(1) Only available in MAX 7000E and MAX 7000S devices.
(2) Not available in 44-pin devices.

The timing characteristics of any signal path can be derived from the timing model and parameters of a particular device. External timing parameters, which represent pin-to-pin timing delays, can be calculated as the sum of internal parameters. Figure 13 shows the internal timing relationship of internal and external delay parameters.

For more infomration, see *Application Note 94 (Understanding MAX 7000 Timing)*.

Figure 13. Switching Waveforms

t_R & t_F < 3 ns.
Inputs are driven at 3 V for a logic high and 0 V for a logic low. All timing characteristics are measured at 1.5 V.



Tables 19 through 26 show the MAX 7000 and MAX 7000E AC operating conditions.

Table 19. MAX 7000 & MAX 7000E External Timing Parameters *Note (1)*

Symbol	Parameter	Conditions	-6 Speed Grade		-7 Speed Grade		Unit
			Min	Max	Min	Max	
t_{PD1}	Input to non-registered output	C1 = 35 pF		6.0		7.5	ns

t_{LPA}	Low-power adder	*(8)*		11.0		10.0		11.0		13.0	ns

Notes to tables:

(1) These values are specified under the recommended operating conditions shown in Table 14. See Figure 13 for more information on switching waveforms.
(2) This minimum pulse width for preset and clear applies for both global clear and array controls. The t_{LPA} parameter must be added to this minimum width if the clear or reset signal incorporates the t_{LAD} parameter into the signal path.
(3) This parameter is a guideline that is sample-tested only and is based on extensive device characterization. This parameter applies for both global and array clocking.
(4) These parameters are measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.
(5) The $\mathbf{f_{MAX}}$ values represent the highest frequency for pipelined data.
(6) Operating conditions: V_{CCIO} = 3.3 V ± 10% for commercial and industrial use.
(7) For EPM7064S-5, EPM7064S-6, EPM7128S-6, EPM7160S-6, EPM7160S-7, EPM7192S-7, and EPM7256S-7 devices, these values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.
(8) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{EN}, t_{SEXP}, $\mathbf{t_{ACL}}$, and $\mathbf{t_{CPPW}}$ parameters for macrocells running in the low-power mode.

Tables 33 and 34 show the EPM7160S AC operating conditions.

Table 33. EPM7160S External Timing Parameters (Part 1 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade								Unit
			-6		-7		-10		-15		
			Min	Max	Min	Max	Min	Max	Min	Max	
$\mathbf{t_{PD1}}$	Input to non-registered output	C1 = 35 pF		6.0		7.5		10.0		15.0	ns

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
$\mathbf{t_{PD1}}$	Input to non-registered output	C1 = 35 pF		7.5		10.0		15.0	ns
$\mathbf{t_{PD2}}$	I/O input to non-registered output	C1 = 35 pF		7.5		10.0		15.0	ns
$\mathbf{t_{SU}}$	Global clock setup time		4.1		7.0		11.0		ns
$\mathbf{t_{H}}$	Global clock hold time		0.0		0.0		0.0		ns
$\mathbf{t_{FSU}}$	Global clock setup time of fast input		3.0		3.0		3.0		ns
$\mathbf{t_{FH}}$	Global clock hold time of fast input		0.0		0.5		0.0		ns
$\mathbf{t_{CO1}}$	Global clock to output delay	C1 = 35 pF		4.7		5.0		8.0	ns
$\mathbf{t_{CH}}$	Global clock high time		3.0		4.0		5.0		ns
$\mathbf{t_{CL}}$	Global clock low time		3.0		4.0		5.0		ns
$\mathbf{t_{ASU}}$	Array clock setup time		1.0		2.0		4.0		ns

Table 35. EPM7192S External Timing Parameters (Part 2 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
t_{AH}	Array clock hold time		1.8		3.0		4.0		ns
t_{ACO1}	Array clock to output delay	C1 = 35 pF		7.8		10.0		15.0	ns
t_{ACH}	Array clock high time		3.0		4.0		6.0		ns
t_{ACL}	Array clock low time		3.0		4.0		6.0		ns
t_{CPPW}	Minimum pulse width for clear and preset	*(2)*	3.0		4.0		6.0		ns
t_{ODH}	Output data hold time after clock	C1 = 35 pF *(3)*	1.0		1.0		1.0		ns
t_{CNT}	Minimum global clock period			8.0		10.0		13.0	ns
f_{CNT}	Maximum internal global clock frequency	*(4)*	125.0		100.0		76.9		MHz
t_{ACNT}	Minimum array clock period			8.0		10.0		13.0	ns
f_{ACNT}	Maximum internal array clock frequency	*(4)*	125.0		100.0		76.9		MHz
f_{MAX}	Maximum clock frequency	*(5)*	166.7		125.0		100.0		MHz

Table 36. EPM7192S Internal Timing Parameters (Part 1 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
t_{IN}	Input pad and buffer delay			0.3		0.5		2.0	ns
t_{IO}	I/O input pad and buffer delay			0.3		0.5		2.0	ns
t_{FIN}	Fast input delay			3.2		1.0		2.0	ns
t_{SEXP}	Shared expander delay			4.2		5.0		8.0	ns
t_{PEXP}	Parallel expander delay			1.2		0.8		1.0	ns
t_{LAD}	Logic array delay			3.1		5.0		6.0	ns
t_{LAC}	Logic control array delay			3.1		5.0		6.0	ns
t_{IOE}	Internal output enable delay			0.9		2.0		3.0	ns
t_{OD1}	Output buffer and pad delay	C1 = 35 pF		0.5		1.5		4.0	ns
t_{OD2}	Output buffer and pad delay	C1 = 35 pF *(6)*		1.0		2.0		5.0	ns
t_{OD3}	Output buffer and pad delay	C1 = 35 pF		5.5		5.5		7.0	ns
t_{ZX1}	Output buffer enable delay	C1 = 35 pF		4.0		5.0		6.0	ns
t_{ZX2}	Output buffer enable delay	C1 = 35 pF *(6)*		4.5		5.5		7.0	ns
t_{ZX3}	Output buffer enable delay	C1 = 35 pF		9.0		9.0		10.0	ns
t_{XZ}	Output buffer disable delay	C1 = 5 pF		4.0		5.0		6.0	ns
t_{SU}	Register setup time		1.1		2.0		4.0		ns

Table 36. EPM7192S Internal Timing Parameters (Part 2 of 2) *Note (1)*

Symbol	Parameter	Conditions	Speed Grade						Unit
			-7		-10		-15		
			Min	Max	Min	Max	Min	Max	
t_H	Register hold time		1.7		3.0		4.0		ns
t_{FSU}	Register setup time of fast input		2.3		3.0		2.0		ns
t_{FH}	Register hold time of fast input		0.7		0.5		1.0		ns
t_{RD}	Register delay			1.4		2.0		1.0	ns
t_{COMB}	Combinatorial delay			1.2		2.0		1.0	ns
t_{IC}	Array clock delay			3.2		5.0		6.0	ns
t_{EN}	Register enable time			3.1		5.0		6.0	ns
t_{GLOB}	Global control delay			2.5		1.0		1.0	ns
t_{PRE}	Register preset time			2.7		3.0		4.0	ns
t_{CLR}	Register clear time			2.7		3.0		4.0	ns
t_{PIA}	PIA delay	*(7)*		2.4		1.0		2.0	ns
t_{LPA}	Low-power adder	*(8)*		10.0		11.0		13.0	ns

Notes to tables:

(1) These values are specified under the recommended operating conditions shown in Table 14. See Figure 13 for more information on switching waveforms.

(2) This minimum pulse width for preset and clear applies for both global clear and array controls. The t_{LPA} parameter must be added to this minimum width if the clear or reset signal incorporates the t_{LAD} parameter into the signal path.

(3) This parameter is a guideline that is sample-tested only and is based on extensive device characterization. This parameter applies for both global and array clocking.

(4) These parameters are measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.

(5) The $\mathbf{f_{MAX}}$ values represent the highest frequency for pipelined data.

(6) Operating conditions: $V_{CCIO} = 3.3\ V \pm 10\%$ for commercial and industrial use.

(7) For EPM7064S-5, EPM7064S-6, EPM7128S-6, EPM7160S-6, EPM7160S-7, EPM7192S-7, and EPM7256S-7 devices, these values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.

(8) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{EN}, t_{SEXP}, $\mathbf{t_{ACL}}$, and $\mathbf{t_{CPPW}}$ parameters for macrocells running in the low-power mode.

Table 39. MAX 7000 I_{CC} Equation Constants

Device	A	B	C
EPM7032	1.87	0.52	0.144
EPM7064	1.63	0.74	0.144
EPM7096	1.63	0.74	0.144
EPM7128E	1.17	0.54	0.096
EPM7160E	1.17	0.54	0.096
EPM7192E	1.17	0.54	0.096
EPM7256E	1.17	0.54	0.096
EPM7032S	0.93	0.40	0.040
EPM7064S	0.93	0.40	0.040
EPM7128S	0.93	0.40	0.040
EPM7160S	0.93	0.40	0.040
EPM7192S	0.93	0.40	0.040
EPM7256S	0.93	0.40	0.040

This calculation provides an I_{CC} estimate based on typical conditions using a pattern of a 16-bit, loadable, enabled, up/down counter in each LAB with no output load. Actual I_{CC} values should be verified during operation because this measurement is sensitive to the actual pattern in the device and the environmental operating conditions.
