Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

(14) To meet the I_{OL} and I_{OH} specifications, you must set the current strength settings accordingly. For example, to meet the SSTL15CI specification (8 mA), you should set the current strength settings to 8 mA. Setting at lower current strength may not meet the I_{OL} and I_{OH} specifications in the datasheet.

Transmitter Pre-Emphasis Levels

The following table lists the simulation data on the transmitter pre-emphasis levels in dB for the first post tap under the following conditions:

- Low-frequency data pattern—five 1s and five 0s
- Data rate—2.5 Gbps

The levels listed are a representation of possible pre-emphasis levels under the specified conditions only and the pre-emphasis levels may change with data pattern and data rate.

Arria V devices only support 1st post tap pre-emphasis with the following conditions:

- The 1st post tap pre-emphasis settings must satisfy $|B| + |C| \leq 60$ where $|B| = V_{OD}$ setting with termination value, $R_{TERM} = 100\ \Omega$ and $|C| = $ 1st post tap pre-emphasis setting.
- $|B| - |C| > 5$ for data rates < 5 Gbps and $|B| - |C| > 8.25$ for data rates > 5 Gbps.
- $(V_{MAX}/V_{MIN} - 1)\% < 600\%$, where $V_{MAX} = |B| + |C|$ and $V_{MIN} = |B| - |C|$.

Exception for PCIe Gen2 design: V_{OD} setting = 43 and pre-emphasis setting = 19 are allowed for PCIe Gen2 design with transmit de-emphasis – 6dB setting (`pipe_txdeemp` = 1'b0) using Altera PCIe Hard IP and PIPE IP cores.

FPP Configuration Timing

DCLK-to-DATA[] Ratio (r) for FPP Configuration

Fast passive parallel (FPP) configuration requires a different DCLK-to-DATA[] ratio when you turn on encryption or the compression feature.

Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is r times the DATA[] rate in byte per second (Bps) or word per second (Wps). For example, in FPP ×16 where the r is 2, the DCLK frequency must be 2 times the DATA[] rate in Wps.

Table 1-65: DCLK-to-DATA[] Ratio for Arria V Devices

Configuration Scheme	Encryption	Compression	DCLK-to-DATA[] Ratio (r)
FPP (8-bit wide)	Off	Off	1
	On	Off	1
	Off	On	2

FPP (16-bit wide)	Off	Off	1

FPP Configuration Timing when DCLK-to-DATA[] = 1

When you enable decompression or the design security feature, the DCLK-to-DATA[] ratio varies for FPP ×8 and FPP ×16. For the respective DCLK-to-DATA[] ratio, refer to the DCLK-to-DATA[] Ratio for Arria V Devices table.

[98] This value can be obtained if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

[99] This value can be obtained if you do not delay configuration by externally holding nSTATUS low.

[100] If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.

[101] N is the DCLK-to-DATA[] ratio and f_{DCLK} is the DCLK frequency of the system.

[155] This clock can be further divided by central or local clock dividers making it possible to use ATX PLL for data rates < 1 Gbps. For more information about ATX PLLs, refer to the Transceiver Clocking in Arria V Devices chapter and the Dynamic Reconfiguration in Arria V Devices chapter.

[156] $t_{pll\_powerdown}$ is the PLL powerdown minimum pulse width.

[157] t_{pll_lock} is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.

Symbol	Parameter	Min	Typ	Max	Unit

	Period Jitter for dedicated clock output in fractional PLL ($f_{OUT} < 100$ MHz)	—	—	25[176], 17.5 [174]	mUI (p-p)
t_{OUTCCJ_DC} [173]	Cycle-to-cycle Jitter for a dedicated clock output in integer PLL ($f_{OUT} \geq 100$ MHz)	—	—	175	ps (p-p)
	Cycle-to-cycle Jitter for a dedicated clock output in integer PLL ($f_{OUT} < 100$ MHz)	—	—	17.5	mUI (p-p)
$t_{FOUTCCJ\_DC}$ [173]	Cycle-to-cycle Jitter for a dedicated clock output in fractional PLL ($f_{OUT} \geq 100$ MHz)	—	—	250[176], 175 [174]	ps (p-p)
	Cycle-to-cycle Jitter for a dedicated clock output in fractional PLL ($f_{OUT} < 100$ MHz)	—	—	25[176], 17.5 [174]	mUI (p-p)

[171] A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source with jitter < 120 ps.
[172] The f_{REF} is fIN/N specification applies when N = 1.
[173] Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.99999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in the "Worst-Case DCD on Arria V GZ I/O Pins" table.
[174] This specification only covered fractional PLL for low bandwidth. The f_{VCO} for fractional value range 0.20–0.80 must be ≥ 1200 MHz.

Symbol	Conditions	C3, I3L			C4, I4			Unit
		Min	Typ	Max	Min	Typ	Max	
True Differential I/O Standards - f_{HSDR} (data rate)	SERDES factor J = 3 to 10 (182), (183)	(184)	—	1250	(184)	—	1050	Mbps
	SERDES factor J ≥ 4 LVDS TX with DPA (185), (186), (187), (188)	(184)	—	1600	(184)	—	1250	Mbps
	SERDES factor J = 2, uses DDR Registers	(184)	—	(189)	(184)	—	(189)	Mbps
	SERDES factor J = 1, uses SDR Register	(184)	—	(189)	(184)	—	(189)	Mbps
Emulated Differential I/O Standards with Three External Output Resistor Networks - f_{HSDR} (data rate) (190)	SERDES factor J = 4 to 10 (191)	(184)	—	840	(184)	—	840	Mbps

(182) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.

(183) The F_{MAX} specification is based on the fast clock used for serial data. The interface F_{MAX} is also dependent on the parallel clock domain which is design dependent and requires timing analysis.

(184) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.

(185) Arria V GZ RX LVDS will need DPA. For Arria V GZ TX LVDS, the receiver side component must have DPA.

(186) Requires package skew compensation with PCB trace length.

(187) Do not mix single-ended I/O buffer within LVDS I/O bank.

(188) Chip-to-chip communication only with a maximum load of 5 pF.

(189) The maximum ideal data rate is the SERDES factor (J) x the PLL maximum output frequency (fOUT) provided you can close the design timing and the signal integrity simulation is clean.

(190) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.

(191) When using True LVDS RX channels for emulated LVDS TX channel, only serialization factors 1 and 2 are supported.
