Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

I/O Standard Specifications

Tables in this section list the input voltage (V_{IH} and V_{IL}), output voltage (V_{OH} and V_{OL}), and current drive characteristics (I_{OH} and I_{OL}) for various I/O standards supported by Arria V devices.

You must perform timing closure analysis to determine the maximum achievable frequency for general purpose I/O standards.

Single-Ended I/O Standards

(13) To meet the I_{OL} and I_{OH} specifications, you must set the current strength settings accordingly. For example, to meet the 3.3-V LVTTL specification (4 mA), you should set the current strength settings to 4 mA. Setting at lower current strength may not meet the I_{OL} and I_{OH} specifications in the datasheet.

(16) The minimum V_{ID} value is applicable over the entire common mode range, V_{CM}.
(17) R_L range: $90 \leq R_L \leq 110\ \Omega$.
(18) This applies to default pre-emphasis setting only.
(19) For optimized LVDS receiver performance, the receiver voltage input range must be within 1.0 V to 1.6 V for data rates above 1.25 Gbps and 0 V to 1.85 V for data rates below 1.25 Gbps.
(20) For optimized RSDS receiver performance, the receiver voltage input range must be within 0.25 V to 1.45 V.
(21) For optimized Mini-LVDS receiver performance, the receiver voltage input range must be within 0.3 V to 1.425 V.
(22) For optimized LVPECL receiver performance, the receiver voltage input range must be within 0.85 V to 1.75 V for data rates above 700 Mbps and 0.45 V to 1.95 V for data rates below 700 Mbps.

(86) This value is based on `rx_sample_dly` = 1 and `spi_m_clk` = 120 MHz. `spi_m_clk` is the internal clock that is used by SPI Master to derive it's `SCLK_OUT`. These timings are based on `rx_sample_dly` of 1. This delay can be adjusted as needed to accommodate slower response times from the slave. Note that a delay of 0 is not allowed. The setup time can be used as a reference starting point. It is very crucial to do a calibration to get the correct `rx_sample_dly` value because each SPI slave device may have different output delay and each application board may have different path delay. For more information about `rx_sample_delay`, refer to the SPI Controller chapter in the Hard Processor System Technical Reference Manual.

POR Specifications

Table 1-63: Fast and Standard POR Delay Specification for Arria V Devices

POR Delay	Minimum	Maximum	Unit
Fast	4	12(91)	ms

(90) A 1-ns adder is required for each $V_{CCIO\ \_HPS}$ voltage step down from 3.0 V. For example, t_{JPCO}= 13 ns if $V_{CCIO\ \_HPS}$ of the TDO I/O bank = 2.5 V, or 14 ns if it equals 1.8 V.

(91) The maximum pulse width of the fast POR delay is 12 ms, providing enough time for the PCIe hard IP to initialize after the POR trip.

		1.25 ±5%	25	k Ω
		1.2 ±5%	25	k Ω

(124) The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, $|I_{IOPIN}| = C\ dv/dt$, in which C is the I/O pin capacitance and dv/dt is the slew rate.
(125) The pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.
(126) These specifications are valid with a ±10% tolerance to cover changes over PVT.

Typical VOD Settings

Table 2-32: Typical V_{OD} Setting for Arria V GZ Channel, TX Termination = 100 Ω

The tolerance is +/-20% for all VOD settings except for settings 2 and below.

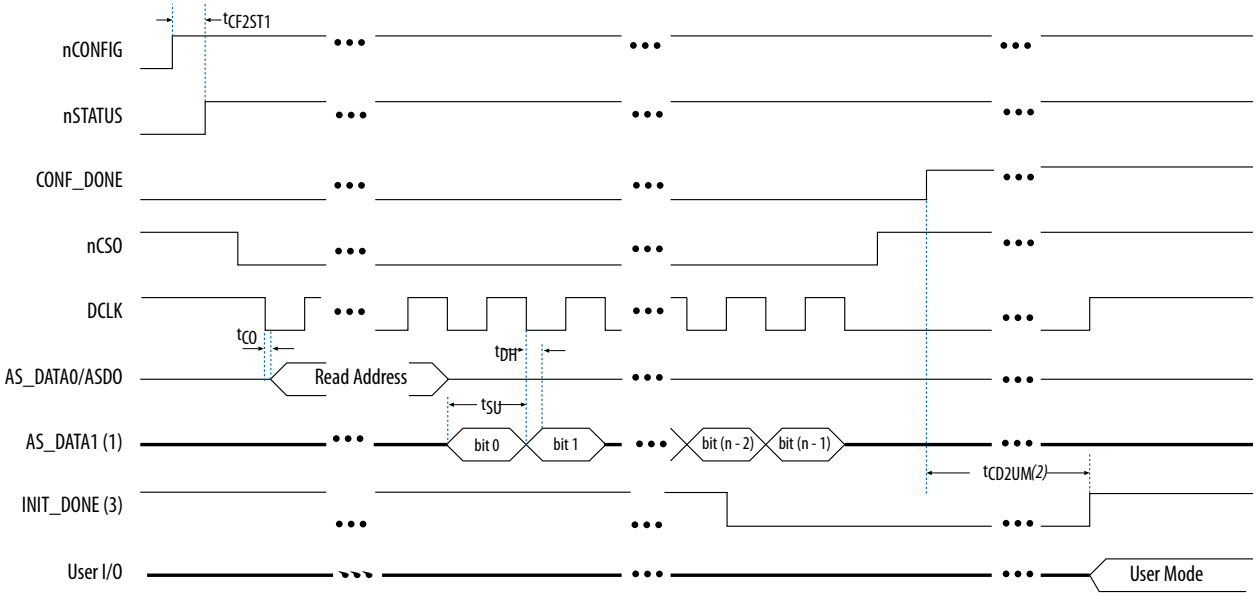
Symbol	V_{OD} Setting	V_{OD} Value (mV)	V_{OD} Setting	V_{OD} Value (mV)
V_{OD} **differential peak to peak typical**	0 (166)	0	32	640
	1 (166)	20	33	660
	2 (166)	40	34	680
	3 (166)	60	35	700
	4 (166)	80	36	720
	5 (166)	100	37	740
	6	120	38	760
	7	140	39	780
	8	160	40	800
	9	180	41	820
	10	200	42	840
	11	220	43	860
	12	240	44	880
	13	260	45	900
	14	280	46	920

(166) If TX termination resistance = 100 Ω,this VOD setting is illegal.

Active Serial Configuration Timing

Figure 2-9: AS Configuration Timing

Timing waveform for the active serial (AS) x1 mode and AS x4 mode configuration timing.



Notes:
1. If you are using AS ×4 mode, this signal represents the AS_DATA[3..0] and EPCQ sends in 4-bits of data for each DCLK cycle.
2. The initialization clock can be from internal oscillator or CLKUSR pin.
3. After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.

Table 2-58: AS Timing Parameters for AS x1 and AS x4 Configurations in Arria V GZ Devices

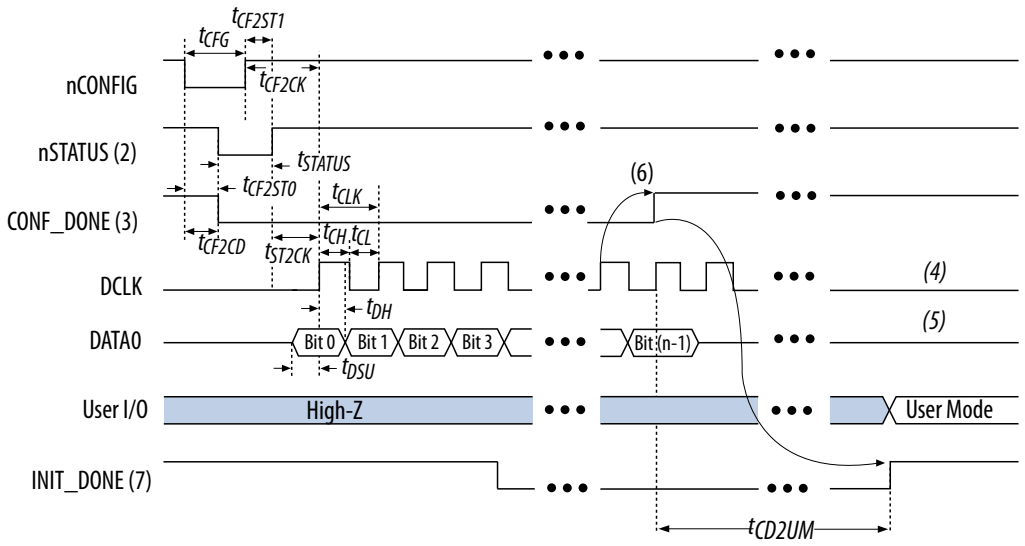
The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

t_{CF2CD}, t_{CF2ST0}, t_{CFG}, t_{STATUS}, and t_{CF2ST1} timing parameters are identical to the timing parameters for PS mode listed in the "PS Timing Parameters for Arria V GZ Devices" table.

Passive Serial Configuration Timing

Figure 2-10: PS Configuration Timing Waveform

Timing waveform for a passive serial (PS) configuration when using a MAX II device, MAX V device, or microprocessor as an external host.



Notes:

1. The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
2. After power-up, the Arria V GZ device holds nSTATUS low for the time of the POR delay.
3. After power-up, before and during configuration, CONF_DONE is low.
4. Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
5. DATA0 is available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings in the Device and Pins Option.
6. To ensure a successful configuration, send the entire configuration data to the Arria V GZ device. CONF_DONE is released high after the Arria V GZ device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
7. After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.

Initialization

Table 2-61: Initialization Clock Source Option and the Maximum Frequency for Arria V GZ Devices

Initialization Clock Source	Configuration Schemes	Maximum Frequency (MHz)	Minimum Number of Clock Cycles
Internal Oscillator	AS, PS, FPP	12.5	8576
CLKUSR (222)	PS, FPP	125	
	AS	100	
DCLK	PS, FPP	125	

Configuration Files

Use the following table to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal file (`.hex`) or tabular text file (`.ttf`) format, have different file sizes.

For the different types of configuration file and file sizes, refer to the Quartus II software. However, for a specific version of the Quartus II software, any design targeted for the same device has the same uncompressed configuration file size.

(221) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the "Initialization" section of the *Configuration, Design Security, and Remote System Upgrades in Arria V Devices* chapter.

(222) To enable CLKUSR as the initialization clock source, turn on the **Enable user-supplied start-up clock (CLKUSR)** option in the Quartus II software from the **General** panel of the **Device and Pin Options** dialog box.
