Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Supply Current and Power Consumption

Altera offers two ways to estimate power for your design—the Excel-based Early Power Estimator (EPE) and the Quartus® Prime PowerPlay Power Analyzer feature.

Use the Excel-based EPE before you start your design to estimate the supply current for your design. The EPE provides a magnitude estimate of the device power because these currents vary greatly with the resources you use.

The Quartus Prime PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yields very accurate power estimates.

(14) To meet the I_{OL} and I_{OH} specifications, you must set the current strength settings accordingly. For example, to meet the SSTL15CI specification (8 mA), you should set the current strength settings to 8 mA. Setting at lower current strength may not meet the I_{OL} and I_{OH} specifications in the datasheet.

Symbol	Description	Min	Max	Unit
T_h	SPI MISO hold time	1	—	ns
$T_{dutycycle}$	SPI_CLK duty cycle	45	55	%
$T_{dssfrst}$	Output delay SPI_SS valid before first clock edge	8	—	ns
T_{dsslst}	Output delay SPI_SS valid after last clock edge	8	—	ns
T_{dio}	Master-out slave-in (MOSI) output delay	–1	1	ns

(86) This value is based on `rx_sample_dly` = 1 and `spi_m_clk` = 120 MHz. `spi_m_clk` is the internal clock that is used by SPI Master to derive it's `SCLK_OUT`. These timings are based on `rx_sample_dly` of 1. This delay can be adjusted as needed to accommodate slower response times from the slave. Note that a delay of 0 is not allowed. The setup time can be used as a reference starting point. It is very crucial to do a calibration to get the correct `rx_sample_dly` value because each SPI slave device may have different output delay and each application board may have different path delay. For more information about `rx_sample_delay`, refer to the SPI Controller chapter in the Hard Processor System Technical Reference Manual.

After the Boot ROM code exits and control is passed to the preloader, software can adjust the value of `drvsel` and `smplsel` via the system manager. `drvsel` can be set from 1 to 7 and `smplsel` can be set from 0 to 7. While the preloader is executing, the values for `SDMMC_CLK` and `SDMMC_CLK_OUT` increase to a maximum of 200 MHz and 50 MHz respectively.

The SD/MMC interface calibration support will be available in a future release of the preloader through the SoC EDS software update.

When J = 3 to 10, use the serializer/deserializer (SERDES) block.

When J = 1 or 2, bypass the SERDES block.

(179) This only applies to DPA and soft-CDR modes.
(180) Clock Boost Factor (W) is the ratio between the input data rate to the input clock rate.
(181) This is achieved by using the LVDS clock network.

Table 2-55: DCLK-to-DATA[] Ratio for Arria V GZ Devices

Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is r times the data rate in bytes per second (Bps), or words per second (Wps). For example, in FPP ×16 when the DCLK-to-DATA[] ratio is 2, the DCLK frequency must be 2 times the data rate in Wps. Arria V GZ devices use the additional clock cycles to decrypt and decompress the configuration data.

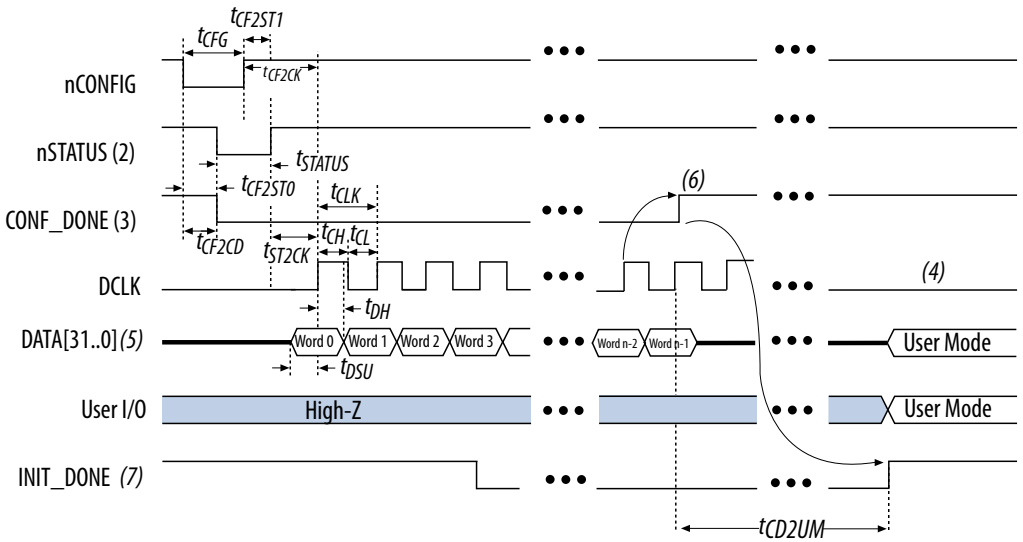
FPP Configuration Timing when DCLK to DATA[] = 1

Figure 2-7: FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1

Timing waveform for FPP configuration when using a MAX® II or MAX V device as an external host.



Notes:
1. The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
2. After power-up, the Arria V GZ device holds nSTATUS low for the time of the POR delay.
3. After power-up, before and during configuration, CONF_DONE is low.
4. Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
5. For FPP ×16, use DATA[15..0]. For FPP ×8, use DATA[7..0]. DATA[31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.
6. To ensure a successful configuration, send the entire configuration data to the Arria V GZ device. CONF_DONE is released high when the Arria V GZ device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
7. After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.

Note: When you enable the decompression or design security feature, the DCLK-to-DATA[] ratio varies for FPP ×8, FPP ×16, and FPP ×32. For the respective DCLK-to-DATA[] ratio, refer to the "DCLK-to-DATA[] Ratio for Arria V GZ Devices" table.

Table 2-56: FPP Timing Parameters for Arria V GZ Devices When the DCLK-to-DATA[] Ratio is 1

Use these timing parameters when the decompression and design security features are disabled.

(205) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
(206) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.
(207) If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.

Initialization

Table 2-61: Initialization Clock Source Option and the Maximum Frequency for Arria V GZ Devices

Initialization Clock Source	Configuration Schemes	Maximum Frequency (MHz)	Minimum Number of Clock Cycles
Internal Oscillator	AS, PS, FPP	12.5	8576
CLKUSR (222)	PS, FPP	125	
	AS	100	
DCLK	PS, FPP	125	

Configuration Files

Use the following table to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal file (`.hex`) or tabular text file (`.ttf`) format, have different file sizes.

For the different types of configuration file and file sizes, refer to the Quartus II software. However, for a specific version of the Quartus II software, any design targeted for the same device has the same uncompressed configuration file size.

(221) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the "Initialization" section of the *Configuration, Design Security, and Remote System Upgrades in Arria V Devices* chapter.

(222) To enable CLKUSR as the initialization clock source, turn on the **Enable user-supplied start-up clock (CLKUSR)** option in the Quartus II software from the **General** panel of the **Device and Pin Options** dialog box.

Date	Version	Changes
July 2014	3.8	• Updated Table 21. • Updated Table 22 V_{OCM} (DC Coupled) condition. • Updated the DCLK note to Figure 6, Figure 7, and Figure 9. • Added note to Table 5 and Table 6. • Added the DCLK specification to Table 50. • Added note to Table 51. • Updated the list of parameters in Table 53.
February 2014	3.7	Updated Table 28.
December 2013	3.6	• Updated Table 2, Table 13, Table 18, Table 19, Table 22, Table 30, Table 33, Table 37, Table 38, Table 45, Table 46, Table 47, Table 56, Table 49. • Updated "PLL Specifications".
August 2013	3.5	Updated Table 28.
August 2013	3.4	• Removed Preliminary tags for Table 2, Table 4, Table 5, Table 14, Table 27, Table 28, Table 29, Table 31, Table 32, Table 43, Table 45, Table 46, Table 47, Table 48, Table 49, Table 50, and Table 54. • Updated Table 2 and Table 28.
June 2013	3.3	Updated Table 23, Table 28, Table 51, and Table 55.
May 2013	3.2	• Added Table 23. • Updated Table 5, Table 22, Table 26, and Table 57. • Updated Figure 6, Figure 7, Figure 8, and Figure 9.
March 2013	3.1	• Updated Table 2, Table 6, Table 7, Table 8, Table 19, Table 22, Table 26, Table 29, Table 52. • Updated "Maximum Allowed Overshoot and Undershoot Voltage".
December 2012	3.0	Initial release.
