Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

⁽¹⁴⁾ To meet the I_{OL} and I_{OH} specifications, you must set the current strength settings accordingly. For example, to meet the SSTL15CI specification (8 mA), you should set the current strength settings to 8 mA. Setting at lower current strength may not meet the I_{OL} and I_{OH} specifications in the datasheet.

Provides the specifications for transmitter, receiver, and reference clock I/O pin.

⁽¹⁶⁾ The minimum V_{ID} value is applicable over the entire common mode range, V_{CM}.

⁽¹⁷⁾ R_L range: 90 ≤ R_L ≤ 110 Ω.

⁽¹⁸⁾ This applies to default pre-emphasis setting only.

⁽¹⁹⁾ For optimized LVDS receiver performance, the receiver voltage input range must be within 1.0 V to 1.6 V for data rates above 1.25 Gbps and 0 V to 1.85 V for data rates below 1.25 Gbps.

⁽²⁰⁾ For optimized RSBS receiver performance, the receiver voltage input range must be within 0.25 V to 1.45 V.

⁽²¹⁾ For optimized Mini-LVDS receiver performance, the receiver voltage input range must be within 0.3 V to 1.425 V.

⁽²²⁾ For optimized LVPECL receiver performance, the receiver voltage input range must be within 0.85 V to 1.75 V for data rates above 700 Mbps and 0.45 V to 1.95 V for data rates below 700 Mbps.

t_{LTD} ⁽⁵⁰⁾	—	4	—	—	μs

⁽⁴⁵⁾ The device cannot tolerate prolonged operation at this absolute maximum.

⁽⁴⁶⁾ The differential eye opening specification at the receiver input pins assumes that you have disabled the **Receiver Equalization** feature. If you enable the **Receiver Equalization** feature, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.

⁽⁴⁷⁾ The AC coupled V_{ICM} is 750 mV for PCIe mode only.

⁽⁴⁸⁾ For standard protocol compliance, use AC coupling.

⁽⁴⁹⁾ t_{LTR} is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.

⁽⁵⁰⁾ t_{LTD} is time required for the receiver CDR to start recovering valid data after the rx_is_lockedto data signal goes high.

Transmitter Pre-Emphasis Levels

The following table lists the simulation data on the transmitter pre-emphasis levels in dB for the first post tap under the following conditions:

- Low-frequency data pattern—five 1s and five 0s
- Data rate—2.5 Gbps

The levels listed are a representation of possible pre-emphasis levels under the specified conditions only and the pre-emphasis levels may change with data pattern and data rate.

Arria V devices only support 1st post tap pre-emphasis with the following conditions:

- The 1st post tap pre-emphasis settings must satisfy $|B| + |C| \leq 60$ where $|B| = V_{OD}$ setting with termination value, $R_{TERM} = 100 \Omega$ and $|C| = 1st$ post tap pre-emphasis setting.
- $|B| - |C| > 5$ for data rates < 5 Gbps and $|B| - |C| > 8.25$ for data rates > 5 Gbps.
- $(V_{MAX}/V_{MIN} - 1)\% < 600\%$, where $V_{MAX} = |B| + |C|$ and $V_{MIN} = |B| - |C|$.

Exception for PCIe Gen2 design: V_{OD} setting = 43 and pre-emphasis setting = 19 are allowed for PCIe Gen2 design with transmit de-emphasis – 6dB setting (pipe_txdeemp = 1'b0) using Altera PCIe Hard IP and PIPE IP cores.

⁽⁵⁸⁾ Convert these values to their binary equivalent form if you are using the dynamic reconfiguration mode for PMA analog controls.

High-Speed I/O Specifications

Table 1-40: High-Speed I/O Specifications for Arria V Devices

When $J = 3$ to 10, use the serializer/deserializer (SERDES) block. When $J = 1$ or 2, bypass the SERDES block.

For LVDS applications, you must use the PLLs in integer PLL mode.

The Arria V devices support the following output standards using true LVDS output buffer types on all I/O banks.

- True RSDS output standard with data rates of up to 360 Mbps
- True mini-LVDS output standard with data rates of up to 400 Mbps

⁽⁷²⁾ Clock boost factor (W) is the ratio between the input data rate and the input clock rate.

⁽⁷³⁾ This applies to DPA and soft-CDR modes only.

⁽⁷⁴⁾ This applies to non-DPA mode only.

⁽⁷⁵⁾ This is achieved by using the LVDS clock network.

⁽⁷⁶⁾ The F_{max} specification is based on the fast clock used for serial data. The interface F_{max} is also dependent on the parallel clock domain which is design dependent and requires timing analysis.

⁽⁷⁷⁾ The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.

Term	Definition
Single-ended voltage referenced I/O standard	The JEDEC standard for the SSTL and HSTL I/O defines both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state. The new logic state is then maintained as long as the input stays beyond the DC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing. Single-Ended Voltage Referenced I/O Standard
t_C	High-speed receiver/transmitter input and output clock period.
TCCS (channel-to-channel-skew)	The timing difference between the fastest and slowest output edges, including the t_{CO} variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the Timing Diagram figure under SW in this table).
t_{DUTY}	High-speed I/O block—Duty cycle on high-speed transmitter output clock.

Maximum Allowed Overshoot and Undershoot Voltage

During transitions, input signals may overshoot to the voltage shown in the following table. They may also undershoot to -2.0 V for input currents less than 100 mA and periods shorter than 20 ns.

Speed grades shown refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Arria V Device Overview*.

The maximum data rate is also constrained by the transceiver speed grade. Refer to the “Commercial and Industrial Speed Grade Offering for Arria V GZ Devices” table for the transceiver speed grade.

⁽¹⁶¹⁾ ATX PLL is recommended at 8 Gbps and above data rates for improved jitter performance.

⁽¹⁶⁴⁾ The Phase Compensation FIFO can be configured in FIFO mode or register mode. In the FIFO mode, the pointers are not fixed, and the latency can vary. In the register mode the pointers are fixed for low latency.
