Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

(67) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.99999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Memory Output Clock Jitter Specification for Arria V Devices table.

(68) This specification only covered fractional PLL for low bandwidth. The f_{VCO} for fractional value range 0.05–0.95 must be ≥ 1000 MHz.

(69) This specification only covered fractional PLL for low bandwidth. The f_{VCO} for fractional value range 0.20–0.80 must be ≥ 1200 MHz.

(70) External memory interface clock output jitter specifications use a different measurement method, which are available in Memory Output Clock Jitter Specification for Arria V Devices table.

HPS PLL Input Jitter

Use the following equation to determine the maximum input jitter (peak-to-peak) the HPS PLLs can tolerate. The divide value (N) is the value programmed into the denominator field of the VCO register for each PLL. The PLL input reference clock is divided by this value. The range of the denominator is 1 to 64.

Maximum input jitter = Input clock period × Divide value (N) × 0.02

Input Reference Clock Period	Divide Value (N)	Maximum Jitter	Unit
40 ns	1	0.8	ns
40 ns	2	1.6	ns

Date	Version	Changes

January 2015	2015.01.30	• Updated the description for $V_{CC\_AUX\_SHARED}$ to "HPS auxiliary power supply" in the following tables:
		  • Absolute Maximum Ratings for Arria V Devices
		  • HPS Power Supply Operating Conditions for Arria V SX and ST Devices
		• Added statement in I/O Standard Specifications: You must perform timing closure analysis to determine the maximum achievable frequency for general purpose I/O standards.
		• Updated the conditions for transceiver reference clock rise time and fall time: Measure at ±60 mV of differential signal. Added a note to the conditions: `REFCLK` performance requires to meet transmitter `REFCLK` phase noise specification.
		• Updated the description in Periphery Performance Specifications to mention that proper timing closure is required in design.
		• Updated HPS Clock Performance main_base_clk specifications from 525 MHz (for –I3 speed grade) and 462 MHz (for –C4 speed grade) to 400 MHz.
		• Updated HPS PLL VCO maximum frequency to 1,600 MHz (for –C5, –I5, and –C6 speed grades), 1,850 MHz (for –C4 speed grade), and 2,100 MHz (for –I3 speed grade).
		• Changed the symbol for HPS PLL input jitter divide value from NR to N.
		• Removed "Slave select pulse width (Texas Instruments SSP mode)" parameter from the following tables:
		  • SPI Master Timing Requirements for Arria V Devices
		  • SPI Slave Timing Requirements for Arria V Devices
		• Added descriptions to USB Timing Characteristics section in HPS Specifications: PHYs that support LPM mode may not function properly with the USB controller due to a timing issue. It is recommended that designers use the MicroChip USB3300 PHY device that has been proven to be successful on the development board.
		• Added HPS JTAG timing specifications.
		• Updated FPGA JTAG timing specifications note as follows: A 1-ns adder is required for each V_{CCIO} voltage step down from 3.0 V. For example, t_{JPCO} = 13 ns if V_{CCIO} of the TDO I/O bank = 2.5 V, or 14 ns if it equals 1.8 V.
		• Updated the value in the V_{ICM} (AC Coupled) row and in note 6 from 650 mV to 750 mV in the Transceiver Specifications for Arria V GT and ST Devices table.

(143) The line data rate may be limited by PCS-FPGA interface speed grade.
(144) To support data rates lower than the minimum specification through oversampling, use the CDR in LTR mode only.
(145) The device cannot tolerate prolonged operation at this absolute maximum.

Programmable Output Buffer Delay

Table 2-67: Programmable Output Buffer Delay for Arria V GZ Devices

You can set the programmable output buffer delay in the Quartus II software by setting the **Output Buffer Delay Control** assignment to either positive, negative, or both edges, with the specific values stated here (in ps) for the **Output Buffer Delay** assignment.

Symbol	Parameter	Typical	Unit
D_{OUTBUF}	Rising and/or falling edge delay	0 (default)	ps
		50	ps
		100	ps
		150	ps

(228) You can set this value in the Quartus II software by selecting **D1**, **D2**, **D3**, **D4**, **D5**, and **D6** in the **Assignment Name** column of **Assignment Editor**.
(229) Minimum offset does not include the intrinsic delay.
