
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Not For New Designs
Core Processor	Coldfire V2
Core Size	32-Bit Single-Core
Speed	100MHz
Connectivity	EBI/EMI, Ethernet, I²C, SPI, UART/USART
Peripherals	DMA, WDT
Number of I/O	61
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	64K x 8
Voltage - Supply (Vcc/Vdd)	1.4V ~ 1.6V
Data Converters	-
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	196-LBGA
Supplier Device Package	196-LBGA (15x15)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/mcf5270vm100

1 MCF5271 Family Configurations

Table 1. MCF5271 Family Configurations

Module	MCF5270	MCF5271
ColdFire V2 Core with EMAC and Hardware Divide	x	x
System Clock	150 MHz	
Performance (Dhrystone/2.1 MIPS)	144	
Instruction/Data Cache	8 Kbytes	
Static RAM (SRAM)	64 Kbytes	
Interrupt Controllers (INTC)	2	2
Edge Port Module (EPORT)	x	x
External Interface Module (EIM)	x	x
4-channel Direct-Memory Access (DMA)	x	x
SDRAM Controller	x	x
Fast Ethernet Controller (FEC)	x	x
Hardware Encryption	—	x
Watchdog Timer (WDT)	x	x
Four Periodic Interrupt Timers (PIT)	x	x
32-bit DMA Timers	4	4
QSPI	x	x
UART(s)	3	3
I^2C	x	x
General Purpose I/O Module (GPIO)	x	x
JTAG - IEEE 1149.1 Test Access Port	x	x
Package	160 QFP, 196 MAPBGA	160 QFP, 196 MAPBGA

2 Block Diagram

The superset device in the MCF5271 family comes in a 196 mold array plastic ball grid array (MAPBGA) package. Figure 1 shows a top-level block diagram of the MCF5271.

3 Features

For a detailed feature list see the MCF5271 Reference Manual (MCF5271RM).

4 Signal Descriptions

This section describes signals that connect off chip, including a table of signal properties. For a more detailed discussion of the MCF5271 signals, consult the *MCF5271 Reference Manual* (MCF5271RM).

4.1 Signal Properties

Table 4 lists all of the signals grouped by function. The "Dir" column is the direction for the primary function of the pin. Refer to Section 6, "Mechanicals/Pinouts and Part Numbers," for package diagrams.

NOTE

In this table and throughout this document a single signal within a group is designated without square brackets (i.e., A24), while designations for multiple signals within a group use brackets (i.e., A[23:21]) and is meant to include all signals within the two bracketed numbers when these numbers are separated by a colon.

NOTE

The primary functionality of a pin is not necessarily its default functionality. Pins that are muxed with GPIO will default to their GPIO functionality.

1 Refers to pin's primary function. All pins which are configurable for GPIO have a pullup enabled in GPIO mode with the exception of PBUSCTL[7], PBUSCTL[4:0], PADDR, PBS, PSDRAM.

2 If JTAG_EN is asserted, these pins default to Alternate 1 (JTAG) functionality. The GPIO module is not responsible for assigning these pins.

5 Design Recommendations

5.1 Layout

- Use a 4-layer printed circuit board with the VDD and GND pins connected directly to the power and ground planes for the MCF5271.
- See application note AN1259, *System Design and Layout Techniques for Noise Reduction in Processor-Based Systems*.
- Match the PC layout trace width and routing to match trace length to operating frequency and board impedance. Add termination (series or therein) to the traces to dampen reflections. Increase the PCB impedance (if possible) keeping the trace lengths balanced and short. Then do cross-talk analysis to separate traces with significant parallelism or are otherwise "noisy". Use 6 mils trace and separation. Clocks get extra separation and more precise balancing.

5.2 Power Supply

- 33 μF, 0.1 μF, and 0.01 μF across each power supply

Table 4. MII Mode (continued)

Signal Description	MCF5271 Pin
Receive error	ERXER
Management channel clock	EMDC
Management channel serial data	EMDIO

The serial mode interface operates in what is generally referred to as AMD mode. The MCF5271 configuration for seven-wire serial mode connections to the external transceiver are shown in Table 5.

Table 5. Seven-Wire Mode Configuration

Signal Description	MCF5271 Pin
Transmit clock	ETXCLK
Transmit enable	ETXEN
Transmit data	ETXD[0]
Collision	ECOL
Receive clock	ERXCLK
Receive enable	ERXDV
Receive data	ERXD[0]
Unused, configure as PB14	ERXER
Unused input, tie to ground	ECRS
Unused, configure as PB[13:11]	ERXD[3:1]
Unused output, ignore	ETXER
Unused, configure as PB[10:8]	ETXD[3:1]
Unused, configure as PB15	EMDC
Input after reset, connect to ground	EMDIO

Refer to the M5271EVB evaluation board user's manual for an example of how to connect an external PHY. Schematics for this board are accessible at the MCF5271 site by navigating to: http://www.freescale.com/coldfire.

5.7.3 BDM

Use the BDM interface as shown in the M5271EVB evaluation board user's manual. The schematics for this board are accessible at the Freescale website at: http://www.freescale.com/coldfire.

6 Mechanicals/Pinouts and Part Numbers

This section contains drawings showing the pinout and the packaging and mechanical characteristics of the MCF5271 devices. See Table 4 for a list the signal names and pin locations for each device.

6.1 Pinout—196 MAPBGA

The following figure shows a pinout of the MCF5270/71CVMxxx package.

Figure 3. MCF5270/71CVMxxx Pinout (196 MAPBGA)

6.3 Pinout—160 QFP

Figure 5 shows a pinout of the MCF5271CABxxx package.

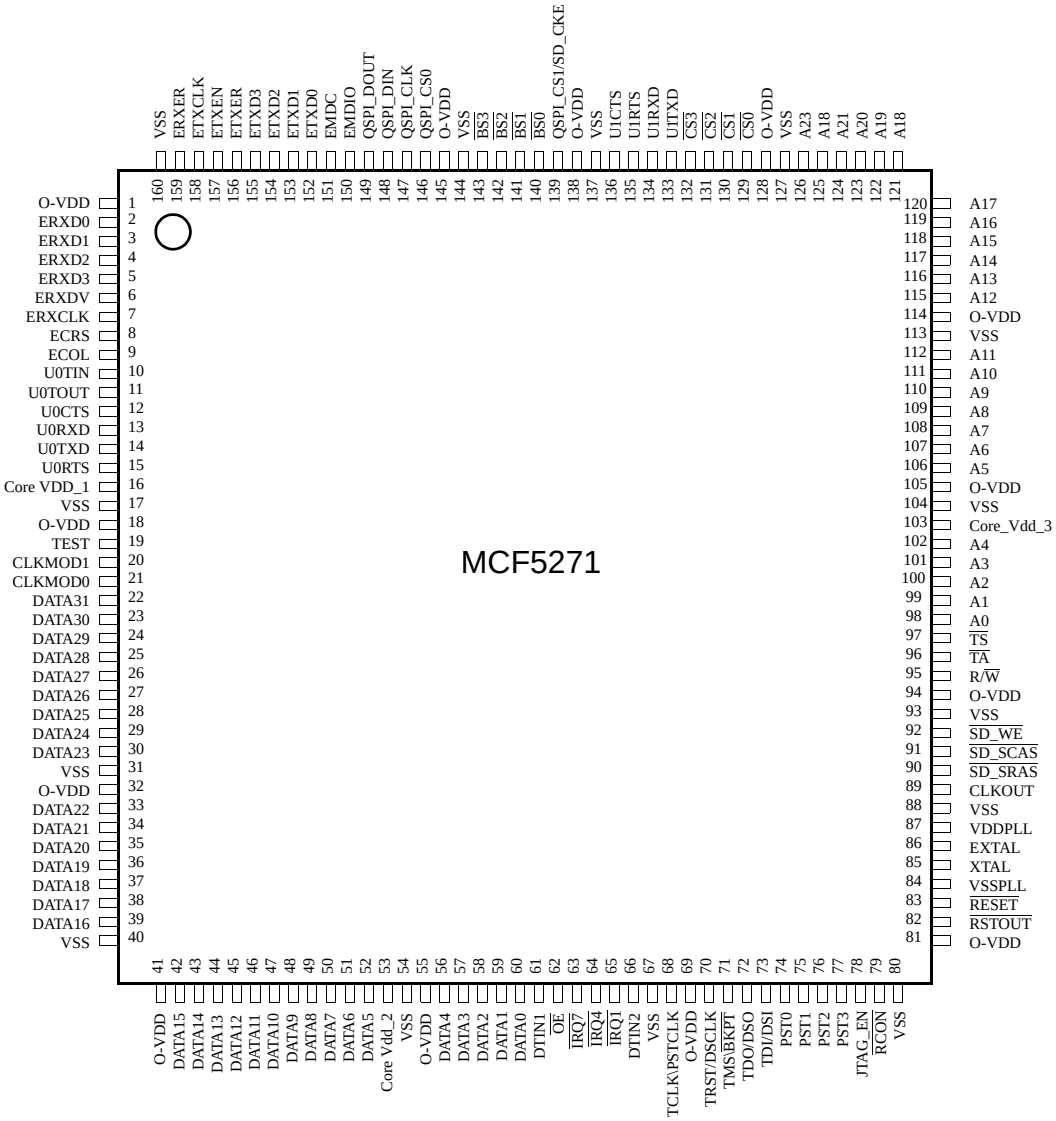

Figure 5. MCF5270/71CABxxx Pinout (160 QFP)

2 This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either V_{SS} or OV_{DD}).

3 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

4 All functional non-supply pins are internally clamped to V_{SS} and OV_{DD}.

5 Power supply must maintain regulation within operating OV_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{in} > OV_{DD}$) is greater than I_{DD}, the injection current may flow out of OV_{DD} and could result in external power supply going out of regulation. Insure external OV_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the processor is not consuming power (ex; no clock).Power supply must maintain regulation within operating OV_{DD} range during instantaneous and operating maximum current conditions.

7.2 Thermal Characteristics

The below table lists thermal resistance values.

Table 8. Thermal Characteristics

Characteristic		Symbol	196 MAPBGA	160QFP	Unit
Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JMA}	32[1,2]	40[1,2]	°C/W
Junction to ambient (@200 ft/min)	Four layer board (2s2p)	θ_{JMA}	29[1,2]	36[1,2]	°C/W
Junction to board		θ_{JB}	20[3]	25[3]	°C/W
Junction to case		θ_{JC}	10[4]	10[4]	°C/W
Junction to top of package		Ψ_{jt}	2[1,5]	2[1,5]	°C/W
Maximum operating junction temperature		T_j	104	105	°C

1 θ_{JMA} and Ψ_{jt} parameters are simulated in conformance with EIA/JESD Standard 51-2 for natural convection. Motorola recommends the use of θ_{JmA} and power dissipation specifications in the system design to prevent device junction temperatures from exceeding the rated specification. System designers should be aware that device junction temperatures can be significantly influenced by board layout and surrounding devices. Conformance to the device junction temperature specification can be verified by physical measurement in the customer's system using the Ψ_{jt} parameter, the device power dissipation, and the method described in EIA/JESD Standard 51-2.

2 Per JEDEC JESD51-6 with the board horizontal.

3 Thermal resistance between the die and the printed circuit board in conformance with JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

4 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

5 Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written in conformance with Psi-JT.

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \Theta_{JMA}) \quad (1)$$

Where:

T_A= Ambient Temperature, °C

Θ_{JMA}= Package Thermal Resistance, Junction-to-Ambient, °C/W

$P_D = P_{INT} + P_{I/O}$

$P_{INT} = I_{DD} \times V_{DD}$, Watts - Chip Internal Power

$P_{I/O}$= Power Dissipation on Input and Output Pins — User Determined

For most applications $P_{I/O} < P_{INT}$ and can be ignored. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273°C) \quad (2)$$

Solving equations 1 and 2 for K gives:

$$K = P_D \times (T_A + 273\ °C) + \Theta_{JMA} \times P_D^2 \quad (3)$$

where K is a constant pertaining to the particular part. K can be determined from equation (3) by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving equations (1) and (2) iteratively for any value of T_A.

7.3 DC Electrical Specifications

Table 9. DC Electrical Specifications[1]

Characteristic	Symbol	Min	Typical	Max	Unit
Core Supply Voltage	V_{DD}	1.4	—	1.6	V
Pad Supply Voltage	OV_{DD}	3.0	—	3.6	V
PLL Supply Voltage	V_{DDPLL}	3.0	—	3.6	V
Input High Voltage	V_{IH}	$0.7 \times OV_{DD}$	—	3.65	V
Input Low Voltage	V_{IL}	$V_{SS} - 0.3$	—	$0.35 \times OV_{DD}$	V
Input Hysteresis	V_{HYS}	$0.06 \times OV_{DD}$	—	—	mV
Input Leakage Current $V_{in} = V_{DD}$ or V_{SS}, Input-only pins	I_{in}	–1.0	—	1.0	µA
High Impedance (Off-State) Leakage Current $V_{in} = V_{DD}$ or V_{SS}, All input/output and output pins	I_{OZ}	–1.0	—	1.0	µA
Output High Voltage (All input/output and all output pins) I_{OH} = –5.0 mA	V_{OH}	OV_{DD} - 0.5	—	—	V
Output Low Voltage (All input/output and all output pins) I_{OL} = 5.0mA	V_{OL}	—	—	0.5	V
Weak Internal Pull Up Device Current, tested at V_{IL} Max.[2]	I_{APU}	–10	—	– 130	µA
Input Capacitance [3] All input-only pins All input/output (three-state) pins	C_{in}	 — —	—	 7 7	pF

Timings listed in Table 11 are shown in Figure 7.

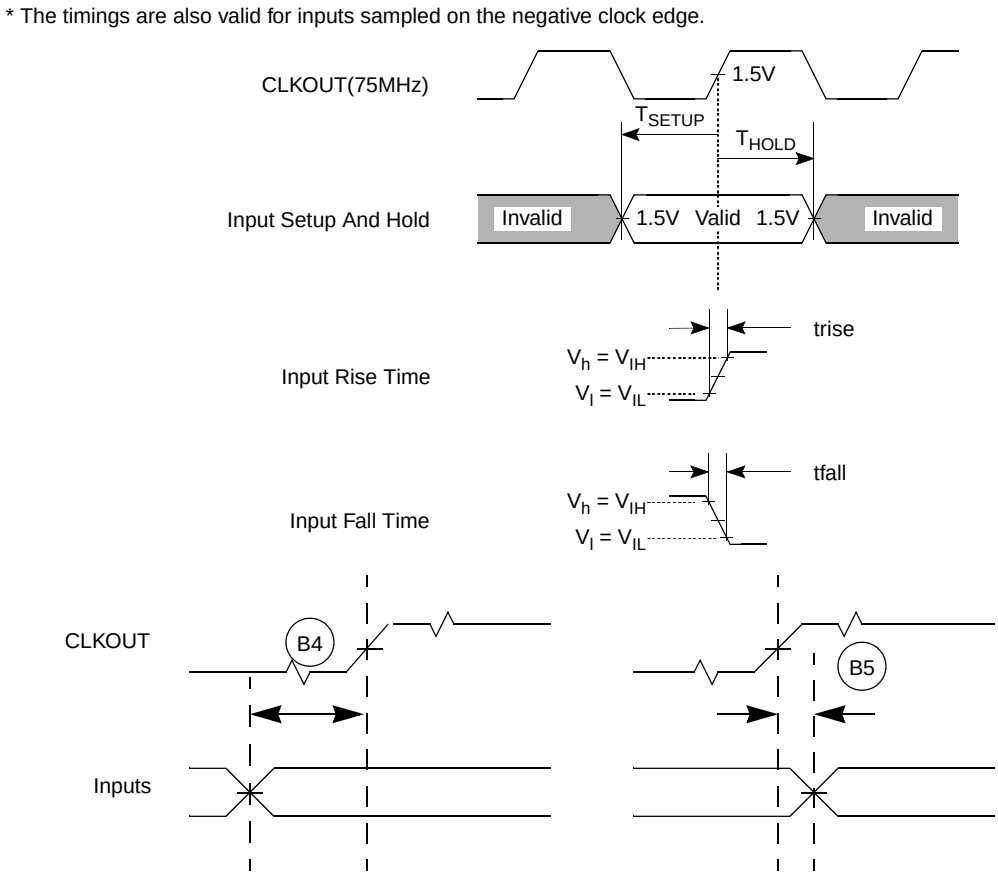

Figure 7. General Input Timing Requirements

7.6 Processor Bus Output Timing Specifications

Table 12 lists processor bus output timings.

Table 12. External Bus Output Timing Specifications

Name	Characteristic	Symbol	Min	Max	Unit
Control Outputs					
B6a	CLKOUT high to chip selects valid [1]	t_{CHCV}	—	$0.5t_{CYC}$ +5	ns
B6b	CLKOUT high to byte enables ($\overline{BS}$[3:0]) valid[2]	t_{CHBV}	—	$0.5t_{CYC}$ +5	ns
B6c	CLKOUT high to output enable ($\overline{OE}$) valid[3]	t_{CHOV}	—	$0.5t_{CYC}$ +5	ns
B7	CLKOUT high to control output ($\overline{BS}$[3:0], $\overline{OE}$) invalid	t_{CHCOI}	$0.5t_{CYC}$+1.5	—	ns
B7a	CLKOUT high to chip selects invalid	t_{CHCI}	$0.5t_{CYC}$+1.5	—	ns

Read/write bus timings listed in Table 12 are shown in Figure 8, Figure 9, and Figure 10.

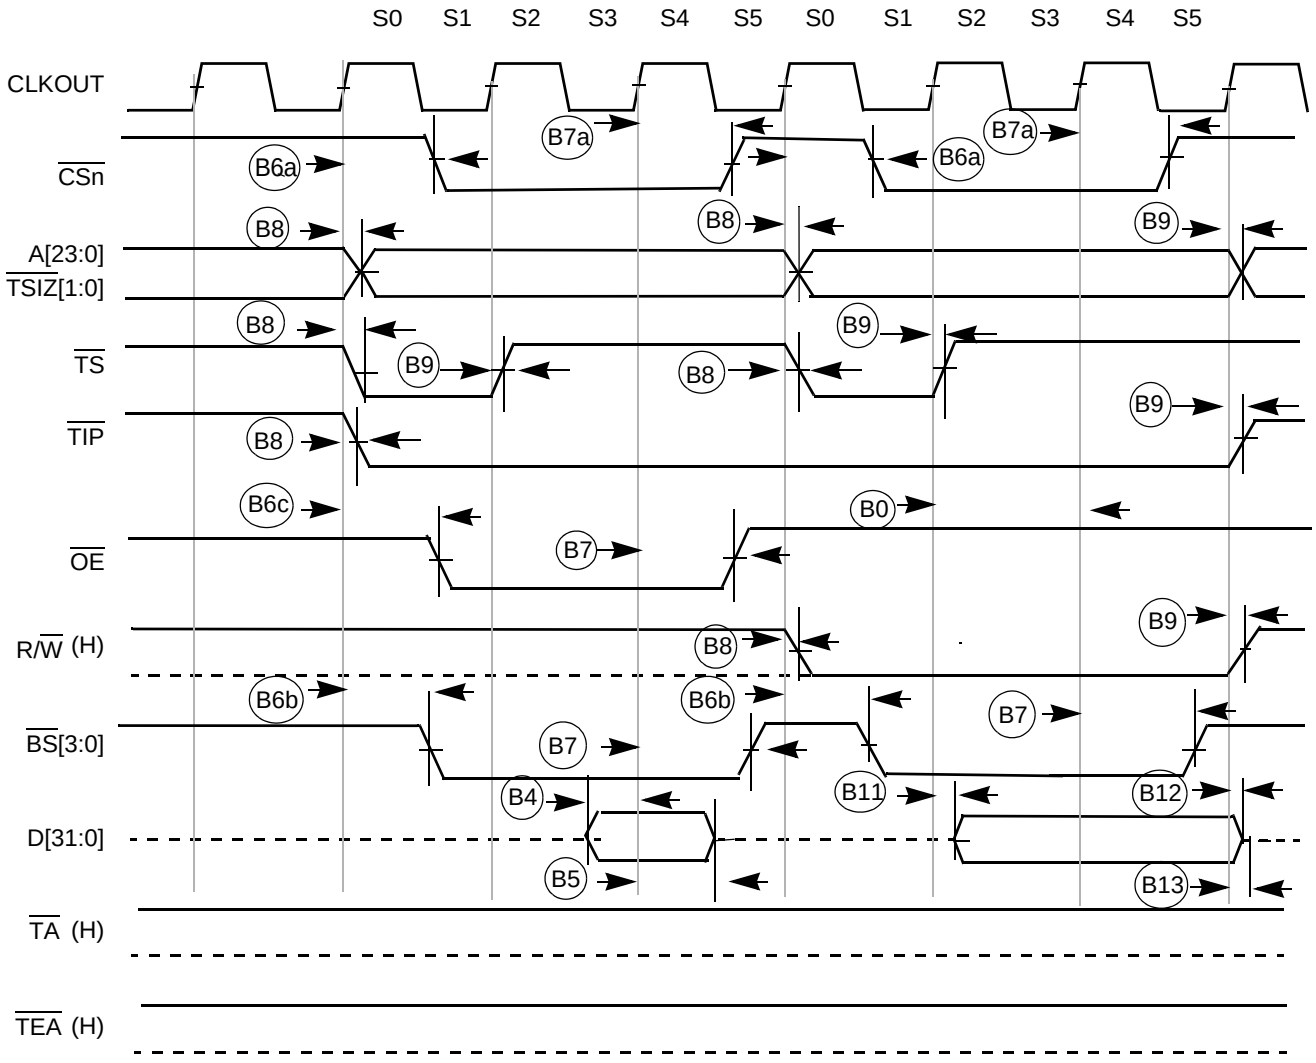

Figure 8. Read/Write (Internally Terminated) SRAM Bus Timing

Figure 9 shows a bus cycle terminated by $\overline{TA}$ showing timings listed in Table 12.

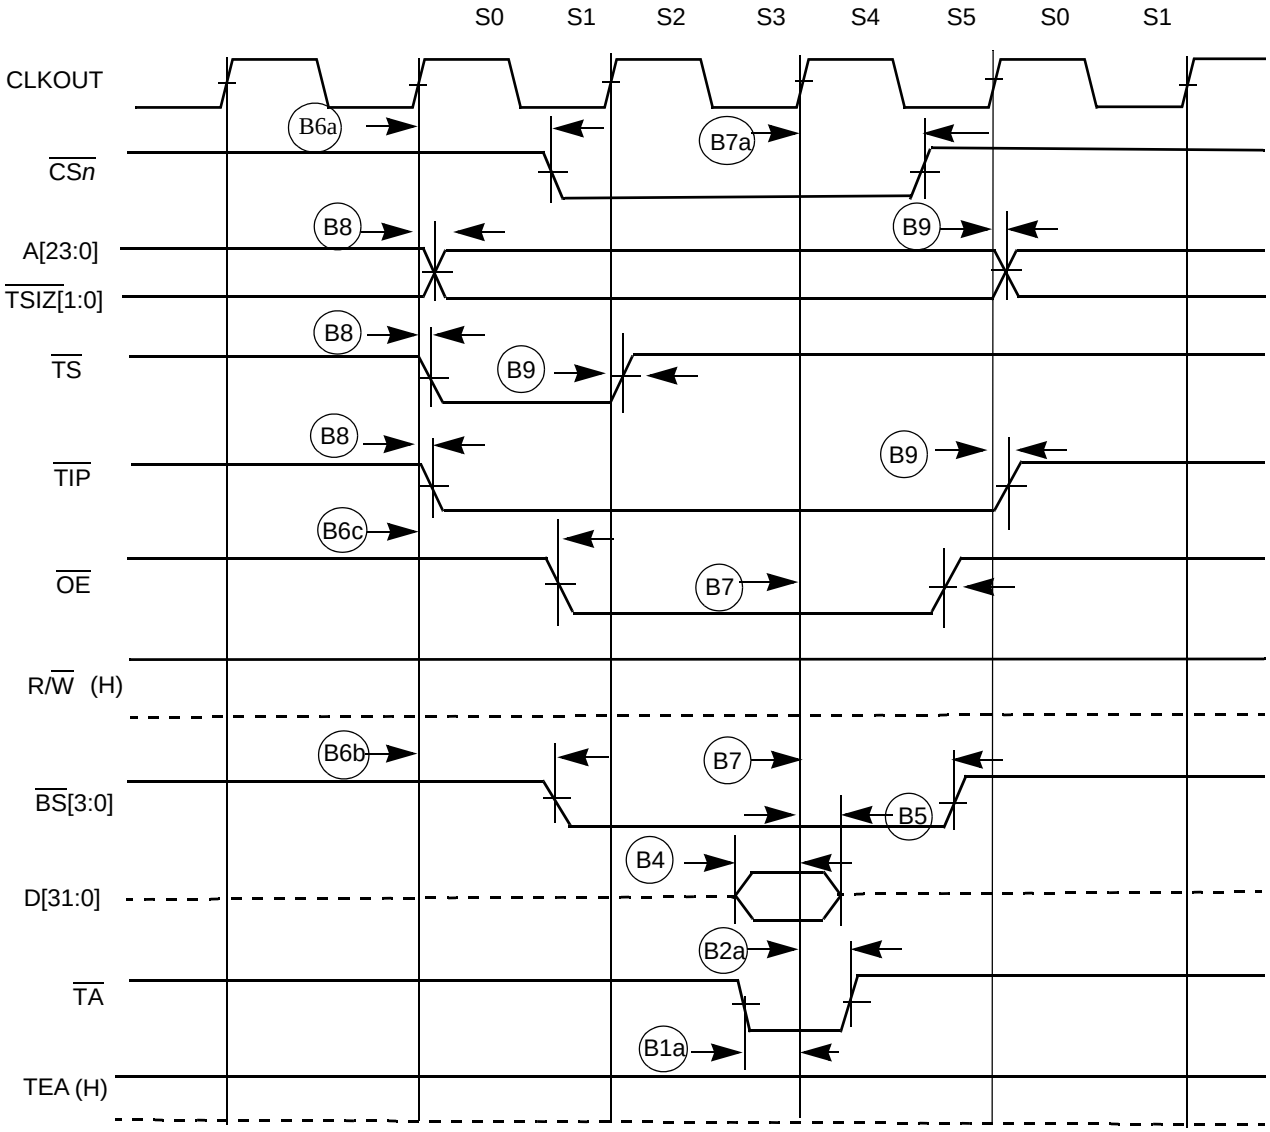

Figure 9. SRAM Read Bus Cycle Terminated by $\overline{TA}$

Figure 10 shows an SRAM bus cycle terminated by $\overline{\text{TEA}}$ showing timings listed in Table 12.

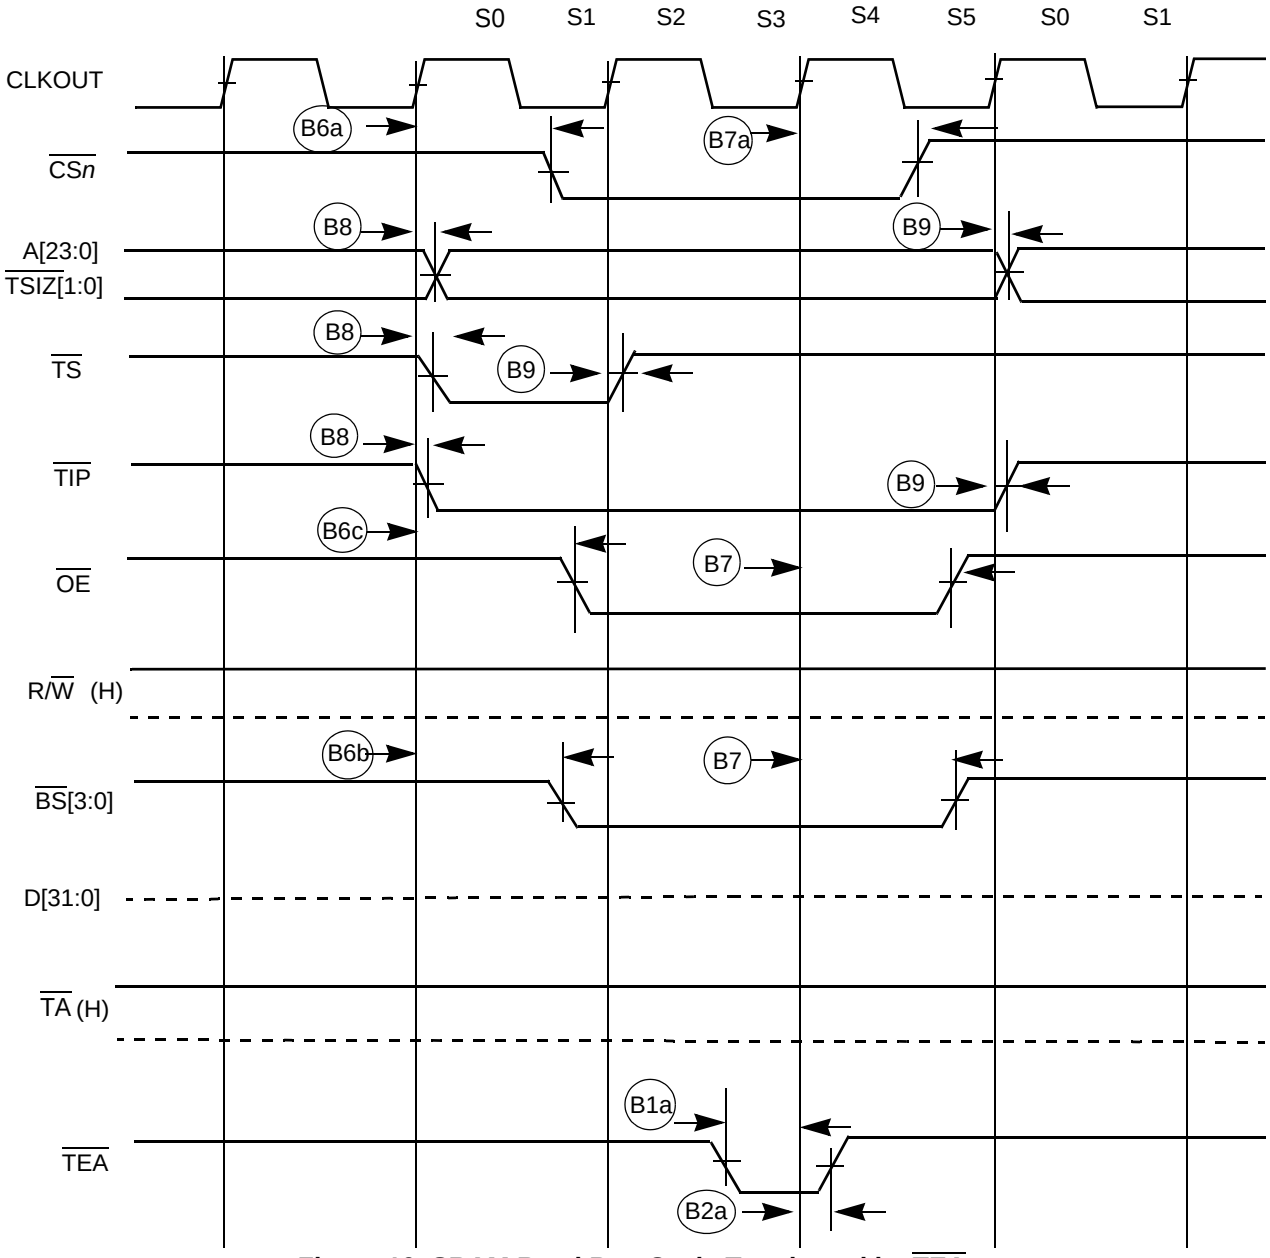

Figure 10. SRAM Read Bus Cycle Terminated by $\overline{\text{TEA}}$

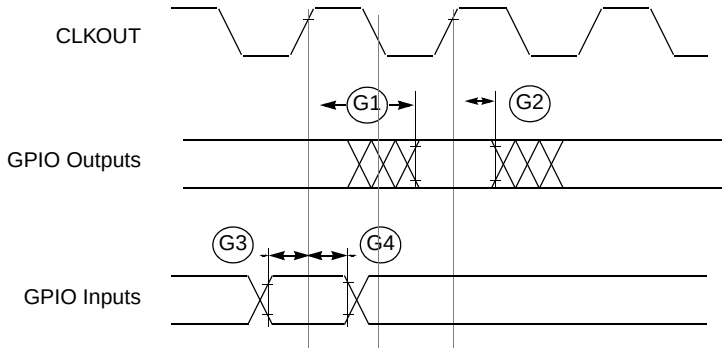

Figure 13. GPIO Timing

7.8 Reset and Configuration Override Timing

Table 15. Reset and Configuration Override Timing
(V_{DD} = 2.7 to 3.6 V, V_{SS} = 0 V, T_A = T_L to T_H)[1]

NUM	Characteristic	Symbol	Min	Max	Unit
R1	$\overline{\text{RESET}}$ Input valid to CLKOUT High	t_{RVCH}	9	—	ns
R2	CLKOUT High to $\overline{\text{RESET}}$ Input invalid	t_{CHRI}	1.5	—	ns
R3	$\overline{\text{RESET}}$ Input valid Time [2]	t_{RIVT}	5	—	t_{CYC}
R4	CLKOUT High to $\overline{\text{RSTOUT}}$ Valid	t_{CHROV}	—	10	ns
R5	$\overline{\text{RSTOUT}}$ valid to Config. Overrides valid	t_{ROVCV}	0	—	ns
R6	Configuration Override Setup Time to $\overline{\text{RSTOUT}}$ invalid	t_{COS}	20	—	t_{CYC}
R7	Configuration Override Hold Time after $\overline{\text{RSTOUT}}$ invalid	t_{COH}	0	—	ns
R8	$\overline{\text{RSTOUT}}$ invalid to Configuration Override High Impedance	t_{ROICZ}	—	1	t_{CYC}

1 All AC timing is shown with respect to 50% V_{DD} levels unless otherwise noted.
2 During low power STOP, the synchronizers for the $\overline{\text{RESET}}$ input are bypassed and $\overline{\text{RESET}}$ is asserted asynchronously to the system. Thus, $\overline{\text{RESET}}$ must be held a minimum of 100 ns.

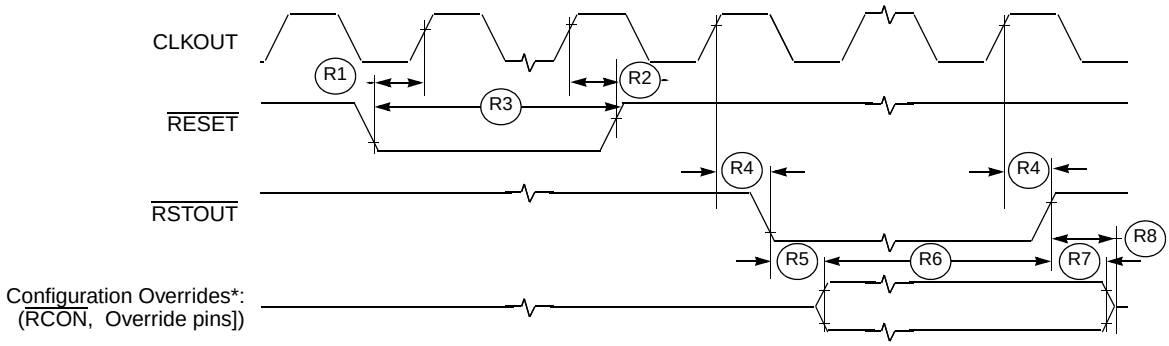

Figure 14. $\overline{\text{RESET}}$ and Configuration Override Timing

Refer to the chip configuration module (CCM) chapter in the device's reference manual for more information.

7.9 I²C Input/Output Timing Specifications

Table 16 lists specifications for the I²C input timing parameters shown in Figure 15.

Table 16. I²C Input Timing Specifications between I2C_SCL and I2C_SDA

Num	Characteristic	Min	Max	Units
I1	Start condition hold time	2	—	t_{cyc}
I2	Clock low period	8	—	t_{cyc}
I3	I2C_SCL/I2C_SDA rise time (V_{IL} = 0.5 V to V_{IH} = 2.4 V)	—	1	ms
I4	Data hold time	0	—	ns
I5	I2C_SCL/I2C_SDA fall time (V_{IH} = 2.4 V to V_{IL} = 0.5 V)	—	1	ms
I6	Clock high time	4	—	t_{cyc}
I7	Data setup time	0	—	ns
I8	Start condition setup time (for repeated start condition only)	2	—	t_{cyc}
I9	Stop condition setup time	2	—	t_{cyc}

Table 17 lists specifications for the I²C output timing parameters shown in Figure 15.

Table 17. I²C Output Timing Specifications between I2C_SCL and I2C_SDA

Num	Characteristic	Min	Max	Units
I1[1]	Start condition hold time	6	—	t_{cyc}
I2 [1]	Clock low period	10	—	t_{cyc}
I3 [2]	I2C_SCL/I2C_SDA rise time (V_{IL} = 0.5 V to V_{IH} = 2.4 V)	—	—	µs
I4 [1]	Data hold time	7	—	t_{cyc}
I5 [3]	I2C_SCL/I2C_SDA fall time (V_{IH} = 2.4 V to V_{IL} = 0.5 V)	—	3	ns
I6 [1]	Clock high time	10	—	t_{cyc}
I7 [1]	Data setup time	2	—	t_{cyc}
I8 [1]	Start condition setup time (for repeated start condition only)	20	—	t_{cyc}
I9 [1]	Stop condition setup time	10	—	t_{cyc}

1 Note: Output numbers depend on the value programmed into the IFDR; an IFDR programmed with the maximum frequency (IFDR = 0x20) results in minimum output timings as shown in Table 17. The I²C interface is designed to scale the actual data transition time to move it to the middle of the I2C_SCL low period. The actual position is affected by the prescale and division values programmed into the IFDR; however, the numbers given in Table 17 are minimum values.

2 Because I2C_SCL and I2C_SDA are open-collector-type outputs, which the processor can only actively drive low, the time I2C_SCL or I2C_SDA take to reach a high level depends on external signal capacitance and pull-up resistor values.

3 Specified at a nominal 50-pF load.

Figure 15 shows timing for the values in Table 16 and Table 17.

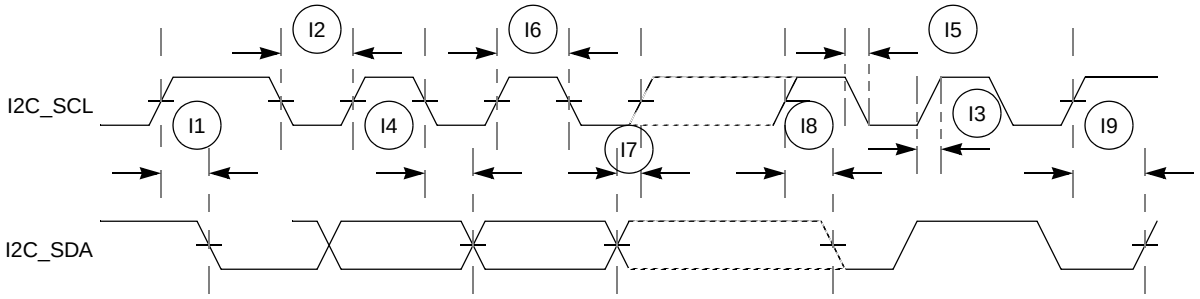

Figure 15. I²C Input/Output Timings

7.10 Fast Ethernet AC Timing Specifications

MII signals use TTL signal levels compatible with devices operating at either 5.0 V or 3.3 V.

7.10.1 MII Receive Signal Timing (ERXD[3:0], ERXDV, ERXER, and ERXCLK)

The receiver functions correctly up to a ERXCLK maximum frequency of 25 MHz +1%. The processor clock frequency must exceed twice the ERXCLK frequency.

Table 18 lists MII receive channel timings.

Table 18. MII Receive Signal Timing

Num	Characteristic	Min	Max	Unit
M1	ERXD[3:0], ERXDV, ERXER to ERXCLK setup	5	—	ns
M2	ERXCLK to ERXD[3:0], ERXDV, ERXER hold	5	—	ns
M3	ERXCLK pulse width high	35%	65%	ERXCLK period
M4	ERXCLK pulse width low	35%	65%	ERXCLK period

Figure 16 shows MII receive signal timings listed in Table 18.

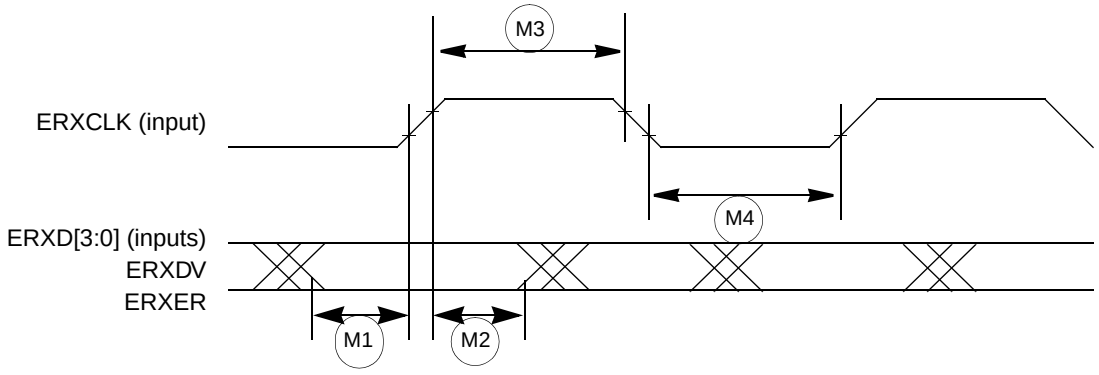

Figure 16. MII Receive Signal Timing Diagram

8 Documentation

Documentation regarding the MCF5271 and their development support tools is available from a local Freescale distributor, a Freescale semiconductor sales office, the Freescale Literature Distribution Center, or through the Freescale web address at http://www.freescale.com/coldfire.

9 Document Revision History

The below table provides a revision history for this document.

Table 26. MCF5271EC Revision History

Rev. No.	Substantive Change(s)
0	Initial release
1	• Fixed several clock values. • Updated Signal List table
1.1	• Removed duplicate information in the module description sections. The information is all in the Signals Description Table.
1.2	• Removed detailed signal description section. This information can be found in the MCF5271RM Chapter 2. • Removed detailed feature list. This information can be found in the MCF5271RM Chapter 1. • Changed instances of Motorola to Freescale • Added values for ‘Maximum operating junction temperature’ in Table 8. • Added typical values for ‘Core operating supply current (master mode)’ in Table 9. • Added typical values for ‘Pad operating supply current (master mode)’ in Table 9. • Removed unnecessary PLL specifications, #6-9, in Table 10.
