

Welcome to E-XFL.COM

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	10MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, LED, POR, WDT
Number of I/O	22
Program Memory Size	7KB (4K x 14)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	176 x 8
Voltage - Supply (Vcc/Vdd)	4V ~ 6V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.300", 7.62mm)
Supplier Device Package	28-SPDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16c642-10i-sp

To Our Valued Customers

We constantly strive to improve the quality of all our products and documentation. We have spent an exceptional amount of time to ensure that these documents are correct. However, we realize that we may have missed a few things. If you find any information that is missing or appears in error, please use the reader response form in the back of this data sheet to inform us. We appreciate your assistance in making this a better document.

PIC16C64X & PIC16C66X

TABLE 3-1: PIC16C641/642 PINOUT DESCRIPTION

Name	Pin #	I/O/P Type	Buffer Type	Description
OSC1/CLKIN	9	I	ST/CMOS	Oscillator crystal input or external clock source input.
OSC2/CLKOUT	10	O	—	Oscillator crystal output. Connects to crystal or resonator in crystal oscillator mode. In RC mode, OSC2 pin outputs CLKOUT which has 1/4 the frequency of OSC1, and denotes the instruction cycle rate.
MCLR/VPP	1	I/P	ST	Master clear (reset) input or programming voltage input. This pin is an active low reset to the device.
RA0/AN0	2	I/O	ST	PORTA is a bi-directional I/O port. Analog comparator input. Analog comparator input. Analog comparator input or VREF output. Analog comparator input or comparator output. Can be selected to be the clock input to the Timer0 timer/counter or a comparator output. Output is open drain type.
RA1/AN1	3	I/O	ST	
RA2/AN2/VREF	4	I/O	ST	
RA3/AN3	5	I/O	ST	
RA4/T0CKI	6	I/O	ST	
RA5	7	I/O	ST	
RB0/INT	21	I/O	TTL/ST ⁽¹⁾	PORTB is a bi-directional I/O port. PORTB can be software programmed for internal weak pull-ups on all inputs. RB0 can also be selected as an external interrupt pin. Interrupt on change pin. Interrupt on change pin. Interrupt on change pin. Serial programming clock. Interrupt on change pin. Serial programming data.
RB1	22	I/O	TTL	
RB2	23	I/O	TTL	
RB3	24	I/O	TTL	
RB4	25	I/O	TTL	
RB5	26	I/O	TTL	
RB6	27	I/O	TTL/ST ⁽²⁾	
RB7	28	I/O	TTL/ST ⁽²⁾	
RC0	11	I/O	ST	PORTC is a bi-directional I/O port.
RC1	12	I/O	ST	
RC2	13	I/O	ST	
RC3	14	I/O	ST	
RC4	15	I/O	ST	
RC5	16	I/O	ST	
RC6	17	I/O	ST	
RC7	18	I/O	ST	
Vss	8,19	P	—	Ground reference for logic and I/O pins.
VDD	20	P	—	Positive supply for logic and I/O pins.

Legend: O = output I/O = input/output P = power
 I = input — = not used ST = Schmitt Trigger input
 TTL = TTL input

Note 1: This buffer is a Schmitt Trigger input when configured as the external interrupt.

2: This buffer is a Schmitt Trigger input when used in serial programming mode.

PIC16C64X & PIC16C66X

4.2.2.4 PIE1 REGISTER

This register contains the individual enable bits for the comparator and Parallel Slave Port interrupts.

FIGURE 4-8: PIE1 REGISTER (ADDRESS 8Ch)

PIC16C64X & PIC16C66X

4.2.2.5 PIR1 REGISTER

This register contains the individual flag bits for the comparator and Parallel Slave Port interrupts.

Note: Interrupt flag bits get set when an interrupt condition occurs regardless of the state of its corresponding enable bit or the global enable bit, GIE (INTCON<7>). User software should ensure the appropriate interrupt flag bits are clear prior to enabling an interrupt.

FIGURE 4-9: PIR1 REGISTER (ADDRESS 0Ch)

R/W-0	R/W-0	U-0	U-0	U-0	U-0	U-0	U-0
PSPIF ⁽¹⁾	CMIF	—	—	—	—	—	—
bit7							bit0

R= Readable bit
W= Writable bit
U= Unimplemented bit, read as '0'
- n= Value at POR reset

bit 7: **PSPIF⁽¹⁾**: Parallel Slave Port Interrupt Flag bit
1 = A read or write operation has taken place (must be cleared in software)
0 = No read or write operation has taken place

bit 6: **CMIF**: Comparator Interrupt Flag bit
1 = Comparator input has changed (must be cleared in software)
0 = Comparator input has not changed

bit 5-0: **Unimplemented**: Read as '0'

Note 1: Bit PSPIF is reserved on the PIC16C641/642, always maintain this bit clear.

PIC16C64X & PIC16C66X

5.3 PORTC and TRISC Registers

PORTC is an 8-bit bi-directional port. Each pin is individually configurable as an input or output through the TRISC register. PORTC pins have Schmitt Trigger input buffers.

EXAMPLE 5-3: INITIALIZING PORTC

```
CLRF    PORTC      ; Initialize PORTC by
                  ; clearing output
                  ; data latches
BSF     STATUS, RP0 ; Select Bank 1
MOVLW   0xCF        ; Value used to
                  ; initialize data
                  ; direction
MOVWF   TRISC       ; Set RC<3:0> as inputs
                  ; RC<5:4> as outputs
                  ; RC<7:6> as inputs
```

FIGURE 5-7: PORTC BLOCK DIAGRAM (IN I/O PORT MODE)

TABLE 5-5: PORTC FUNCTIONS

Name	Bit#	Buffer Type	Function
RC0	bit0	ST	Input/output
RC1	bit1	ST	Input/output
RC2	bit2	ST	Input/output
RC3	bit3	ST	Input/output
RC4	bit4	ST	Input/output
RC5	bit5	ST	Input/output
RC6	bit6	ST	Input/output
RC7	bit7	ST	Input/output

Legend: ST = Schmitt Trigger input

TABLE 5-6: SUMMARY OF REGISTERS ASSOCIATED WITH PORTC

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on: POR, BOR	Value on all other resets
07h	PORTC	RC7	RC6	RC5	RC4	RC3	RC2	RC1	RC0	xxxx xxxx	uuuu uuuu
87h	TRISC	TRISC7	TRISC6	TRISC5	TRISC4	TRISC3	TRISC2	TRISC1	TRISC0	1111 1111	1111 1111

Legend: x = unknown, u = unchanged.

6.2 Using Timer0 with External Clock

When an external clock input is used for Timer0, it must meet certain requirements. The requirements ensure the external clock can be synchronized with the internal phase clock (Tosc). Also, there is a delay in the actual incrementing of Timer0 after synchronization.

6.2.1 EXTERNAL CLOCK SYNCHRONIZATION

When no prescaler is used, the external clock input is the same as the prescaler output. The synchronization of T0CKI with the internal phase clocks is accomplished by sampling the prescaler output on the Q2 and Q4 cycles of the internal phase clocks (Figure 6-5). Therefore, it is necessary for T0CKI to be high for at least 2Tosc (and a small RC delay of 20 ns) and low for at least 2Tosc (and a small RC delay of 20 ns). Refer to the electrical specification of the desired device.

When a prescaler is used, the external clock input is divided by the asynchronous ripple-counter type prescaler so that the prescaler output is symmetrical. For the external clock to meet the sampling requirement, the ripple-counter must be taken into account. Therefore, it is necessary for T0CKI to have a period of at least 4Tosc (and a small RC delay of 40 ns) divided by the prescaler value. The only requirement on T0CKI high and low time is that they do not violate the minimum pulse width requirement of 10 ns. Refer to parameters 40, 41, and 42 in the electrical specification of the desired device.

6.2.2 TIMER0 INCREMENT DELAY

Since the prescaler output is synchronized with the internal clocks, there is a small delay from the time the external clock edge occurs to the time the Timer0 module is actually incremented. Figure 6-5 shows the delay from the external clock edge to the timer incrementing.

FIGURE 6-5: TIMER0 TIMING WITH EXTERNAL CLOCK

PIC16C64X & PIC16C66X

6.3.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control, i.e., it can be changed “on the fly” during program execution.

Note: To avoid an unintended device RESET, the following instruction sequence (shown in Example 6-1) must be executed when changing the prescaler assignment from Timer0 to the WDT. This precaution must be followed even if the WDT is disabled.

EXAMPLE 6-1: CHANGING PRESCALER (TIMER0→WDT)

```
BCF    STATUS, RP0    ;Bank 0
CLRF   TMR0           ;Clear TMR0 & Prescaler
BSF    STATUS, RP0    ;Bank 1
CLRWDT           ;Clears WDT
MOVLW  b'xxxxlxxx'    ;Select new prescale
MOVWF  OPTION_REG     ;value & WDT
BCF    STATUS, RP0    ;Bank 0
```

To change prescaler from the WDT to the Timer0 module, use the sequence shown in Example 6-2.

EXAMPLE 6-2: CHANGING PRESCALER (WDT→TIMER0)

```
CLRWDT           ;Clear WDT and
                ;prescaler
BSF    STATUS, RP0  ;Bank 1
MOVLW  b'xxx0xxx'   ;Select TMR0, new
                ;prescale value and
MOVWF  OPTION_REG   ;clock source
BCF    STATUS, RP0  ;Bank 0
```

TABLE 6-1: REGISTERS ASSOCIATED WITH TIMER0

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on: POR, BOR	Value on all other resets
01h	TMR0	Timer0 module's register								xxxx xxxx	uuuu uuuu

PIC16C64X & PIC16C66X

9.2.3 EXTERNAL CRYSTAL OSCILLATOR CIRCUIT

Either a prepackaged oscillator can be used or a simple oscillator circuit with TTL gates can be built. Prepackaged oscillators provide a wide operating range and better stability. A well-designed crystal oscillator will provide good performance with TTL gates. Two types of crystal oscillator circuits can be used: one with series resonance, or one with parallel resonance.

Figure 9-4 shows implementation of a parallel resonant oscillator circuit. The circuit is designed to use the fundamental frequency of the crystal. The 74AS04 inverter performs the 180-degree phase shift that a parallel oscillator requires. The 4.7 k Ω resistor provides the negative feedback for stability. The 10 k Ω potentiometer biases the 74AS04 in the linear region. This could be used for external oscillator designs.

FIGURE 9-4: EXTERNAL PARALLEL RESONANT CRYSTAL OSCILLATOR CIRCUIT

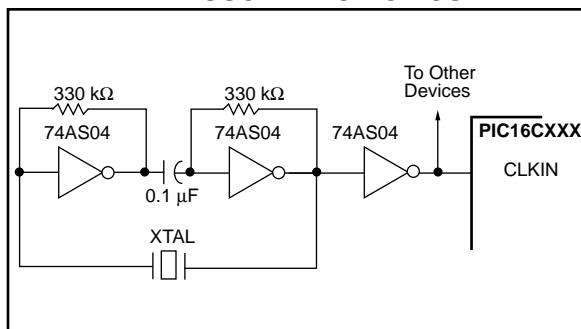

Figure 9-5 shows a series resonant oscillator circuit. This circuit is also designed to use the fundamental frequency of the crystal. The inverter performs a 180-degree phase shift in a series resonant oscillator circuit. The 330 k Ω resistors provide the negative feedback to bias the inverters in their linear region.

FIGURE 9-5: EXTERNAL SERIES RESONANT CRYSTAL OSCILLATOR CIRCUIT

9.2.4 RC OSCILLATOR

For timing insensitive applications the "RC" device option offers additional cost savings. The RC oscillator frequency is a function of the supply voltage, the resistor (R_{ext}) and capacitor (C_{ext}) values, and the operating temperature. In addition to this, the oscillator frequency will vary from unit to unit due to normal process parameter variation. Furthermore, the difference in lead frame capacitance between package types will also affect the oscillation frequency, especially for low C_{ext} values. The user also needs to take into account variation due to tolerance of external R and C components used. Figure 9-6 shows how the R/C combination is connected to the PIC16CXXX. For R_{ext} values below 2.2 k Ω , the oscillator operation may become unstable, or stop completely. For very high R_{ext} values (e.g. 1 M Ω), the oscillator becomes sensitive to noise, humidity and leakage. Thus, we recommend to keep R_{ext} between 3 k Ω and 100 k Ω .

Although the oscillator will operate with no external capacitor ($C_{ext} = 0$ pF), we recommend using values above 20 pF for noise and stability reasons. With no or small external capacitance, the oscillation frequency can vary dramatically due to changes in external capacitances, such as PCB trace capacitance or package lead frame capacitance.

See characterization data for desired device for RC frequency variation from part to part due to normal process variation. The variation is larger for larger R (since leakage current variation will affect RC frequency more for large R) and for smaller C (since variation of input capacitance will affect RC frequency more).

See characterization data for desired device for variation of oscillator frequency due to V_{DD} for given R_{ext}/C_{ext} values as well as frequency variation due to operating temperature for given R, C, and V_{DD} values.

The oscillator frequency, divided by 4, is available on the OSC2/CLKOUT pin, and can be used for test purposes or to synchronize other logic (see Figure 3-3 for waveform).

FIGURE 9-6: RC OSCILLATOR MODE

PIC16C64X & PIC16C66X

9.7 Watchdog Timer (WDT)

The Watchdog Timer (WDT) is a free running on-chip RC oscillator which does not require any external components. The block diagram is shown in Figure 9-17. This RC oscillator is separate from the RC oscillator of the OSC1/CLKIN pin. This means that the WDT will run, even if the clock on the OSC1 and OSC2 pins has been stopped, for example, by execution of a *SLEEP* instruction. During normal operation, a WDT time-out generates a device RESET. If the device is in *SLEEP* mode, a WDT time-out causes the device to wake-up and continue with normal operation, this is known as a WDT wake-up. The WDT can be permanently disabled by clearing configuration bit WDTE (Section 9.1).

9.7.1 WDT PERIOD

The WDT has a nominal time-out period of 18 ms, (with no prescaler). The time-out period varies with temperature, VDD and process variations from part to part (see DC specs). If longer time-outs are desired, a prescaler with a division ratio of up to 1:128 can be assigned to

the WDT, under software control, by writing to the OPTION register. Thus, time-out periods of up to 2.3 seconds can be realized.

The *CLRWDT* and *SLEEP* instructions clear the WDT and the postscaler (if assigned to the WDT) and prevent it from timing out and generating a device RESET.

The $\overline{\text{TO}}$ bit in the STATUS register will be cleared upon a Watchdog Timer time-out (WDT Reset and WDT wake-up).

9.7.2 WDT PROGRAMMING CONSIDERATIONS

It should also be taken in account that under worst case conditions (VDD = Min., Temperature = Max., max. WDT prescaler) it may take several seconds before a WDT time-out occurs.

Note: When the prescaler is assigned to the WDT, always execute a *CLRWDT* instruction before changing the prescale value, otherwise a WDT reset may occur.

FIGURE 9-17: WATCHDOG TIMER BLOCK DIAGRAM

FIGURE 9-18: SUMMARY OF WATCHDOG TIMER REGISTERS

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
2007h	Config. bits	MPEEN	BODEN ⁽¹⁾	CP1	CP0	$\overline{\text{PWRTE}}$ ⁽¹⁾	WDTE	FOSC1	FOSC0
81h	OPTION	RBPUP	INTEDG	T0CS	T0SE	PSA	PS2	PS1	PS0

Legend: Shaded cells are not used by the Watchdog Timer.

Note 1: See Figure 9-1 for details of the operation of these bits.

PIC16C64X & PIC16C66X

TABLE 10-2: INSTRUCTION SET

Mnemonic, Operands	Description	Cycles	14-Bit Opcode				Status Affected	Notes	
			MSb		LSb				
BYTE-ORIENTED FILE REGISTER OPERATIONS									
ADDWF	f, d	Add W and f	1	00	0111	dfff	ffff	C,DC,Z	1,2

BTFSC	f, b	Bit Test f, Skip if Clear	1 (2)	01	10bb	bfff	ffff		3
BTFSS	f, b	Bit Test f, Skip if Set	1 (2)	01	11bb	bfff	ffff		3
LITERAL AND CONTROL OPERATIONS									
ADDLW	k	Add literal and W	1	11	111x	kkkk	kkkk	C,DC,Z	
ANDLW	k	AND literal with W	1	11	1001	kkkk	kkkk	Z	
CALL	k	Call subroutine	2	10	0kkk	kkkk	kkkk		
CLRWDT	-	Clear Watchdog Timer	1	00	0000	0110	0100	TO,PD	
GOTO	k	Go to address	2	10	1kkk	kkkk	kkkk		
IORLW	k	Inclusive OR literal with W	1	11	1000	kkkk	kkkk	Z	
MOVLW	k	Move literal to W	1	11	00xx	kkkk	kkkk		
RETFIE	-	Return from interrupt	2	00	0000	0000	1001		
RETLW	k	Return with literal in W	2	11	01xx	kkkk	kkkk		
RETURN	-	Return from Subroutine	2	00	0000	0000	1000		
SLEEP	-	Go into standby mode	1	00	0000	0110	0011	TO,PD	
SUBLW	k	Subtract W from literal	1	11	110x	kkkk	kkkk	C,DC,Z	
XORLW	k	Exclusive OR literal with W	1	11	1010	kkkk	kkkk	Z	

- Note 1: When an I/O register is modified as a function of itself (e.g., `MOVF PORTB, 1`), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.
- 2: If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared if assigned to the Timer0 Module.
- 3: If Program Counter (PC) is modified or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a NOP.

PIC16C64X & PIC16C66X

NOP No Operation

Syntax: [*label*] NOP

Operands: None

Operation: No operation

Status Affected: None

Encoding:

00	0000	0xx0	0000
----	------	------	------

Description: No operation.

Words: 1

Cycles: 1

Example NOP

RETFIE Return from Interrupt

Syntax: [*label*] RETFIE

Operands: None

Operation: TOS → PC,
1 → GIE

Status Affected: None

Encoding:

00	0000	0000	1001
----	------	------	------

Description: Return from Interrupt. Stack is POPed and Top of Stack (TOS) is loaded in the PC. Interrupts are enabled by setting Global Interrupt Enable bit, GIE (INTCON<7>). This is a two cycle instruction.

Words: 1

Cycles: 2

Example RETFIE

After Interrupt

PC = TOS
GIE = 1

OPTION Load Option Register

Syntax: [*label*] OPTION

Operands: None

Operation: (W) → OPTION

Status Affected: None

Encoding:

00	0000	0110	0010
----	------	------	------

Description: The contents of the W register are loaded in the OPTION register. This instruction is supported for code compatibility with PIC16C5X products. Since OPTION is a readable/writable register, the user can directly address it.

Words: 1

Cycles: 1

Example

To maintain upward compatibility with future PIC16CXX products, do not use this instruction.

RETLW Return with Literal in W

Syntax: [*label*] RETLW k

Operands: $0 \leq k \leq 255$

Operation: k → (W);
TOS → PC

Status Affected: None

Encoding:

11	01xx	kkkk	kkkk
----	------	------	------

Description: The W register is loaded with the eight bit literal 'k'. The program counter is loaded from the top of the stack (the return address). This is a two cycle instruction.

Words: 1

Cycles: 2

Example

```
CALL TABLE      ;W contains table
                  ;offset value
                  ;W now has table value
.
.
.
TABLE ADDWF PC    ;W = offset
      RETLW k1    ;Begin table
      RETLW k2    ;
      .
      .
      RETLW kn    ; End of table
```

Before Instruction

W = 0x07

After Instruction

W = value of k8

PIC16C64X & PIC16C66X

SWAPF		Swap Nibbles in f							
Syntax:	[<i>label</i>] SWAPF f,d								
Operands:	0 ≤ f ≤ 127 d ∈ [0,1]								
Operation:	(f<3:0>) → (dest<7:4>), (f<7:4>) → (dest<3:0>)								
Status Affected:	None								
Encoding:	<table><tr><td>00</td><td>1110</td><td>dfff</td><td>ffff</td></tr></table>					00	1110	dfff	ffff
00	1110	dfff	ffff						
Description:	The upper and lower nibbles of register 'f' are exchanged. If 'd' is 0 the result is placed in W register. If 'd' is 1 the result is placed in register 'f'.								
Words:	1								
Cycles:	1								
Example	SWAPF REG, 0								
Before Instruction									
REG1 = 0xA5									
After Instruction									
REG1 = 0xA5									
W = 0x5A									

XORLW

Exclusive OR Literal with W

Syntax:

[*label*] XORLW k

Operands:

0 ≤ k ≤ 255

Operation:

(W) .XOR. k → (W)

Status Affected:

Z

Encoding:

11	1010	kkkk	kkkk
----	------	------	------

Description:

The contents of the W register are XOR'ed with the eight bit literal 'k'. The result is placed in the W register.

Words:

1

Cycles:

1

Example:

XORLW 0xAF

Before Instruction

W = 0xB5

After Instruction

W = 0x1A

TRIS	Load TRIS Register				
Syntax:	[<i>label</i>] TRIS f				
Operands:	$5 \leq f \leq 7$				
Operation:	(W) → TRIS register f;				
Status Affected:	None				
Encoding:	<table><tr><td>00</td><td>0000</td><td>0110</td><td>0fff</td></tr></table>	00	0000	0110	0fff
00	0000	0110	0fff		
Description:	The instruction is supported for code compatibility with the PIC16C5X products. Since TRIS registers are readable and writable, the user can directly address them.				
Words:	1				
Cycles:	1				
Example	<div>To maintain upward compatibility with future PIC16CXX products, do not use this instruction.</div>				

XORWF	Exclusive OR W with f												
Syntax:	[<i>label</i>] XORWF f,d												
Operands:	$0 \leq f \leq 127$ $d \in [0,1]$												
Operation:	(W) .XOR. (f) \rightarrow (dest)												
Status Affected:	Z												
Encoding:	<table><tr><td>00</td><td>0110</td><td>dfff</td><td>ffff</td></tr></table>	00	0110	dfff	ffff								
00	0110	dfff	ffff										
Description:	Exclusive OR the contents of the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.												
Words:	1												
Cycles:	1												
Example	<pre>XORWF REG 1</pre> <p>Before Instruction</p> <table><tr><td>REG</td><td>=</td><td>0xAF</td></tr><tr><td>W</td><td>=</td><td>0xB5</td></tr></table> <p>After Instruction</p> <table><tr><td>REG</td><td>=</td><td>0x1A</td></tr><tr><td>W</td><td>=</td><td>0xB5</td></tr></table>	REG	=	0xAF	W	=	0xB5	REG	=	0x1A	W	=	0xB5
REG	=	0xAF											
W	=	0xB5											
REG	=	0x1A											
W	=	0xB5											

PIC16C64X & PIC16C66X

12.1 DC Characteristics: PIC16C641/642/661/662-04 (Commercial, Industrial, Automotive) PIC16C641/642/661/662-10 (Commercial, Industrial, Automotive) PIC16C641/642/661/662-20 (Commercial, Industrial, Automotive)

Standard Operating Conditions (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for industrial, $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$ commercial, and $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ automotive							
Param No.	Sym	Characteristic	Min	Typ†	Max	Units	Conditions

D021	IPD	Power-down Current ⁽³⁾	— —	1.5 2.5	21 24	μA μA	VDD = 4.0V, WDT disabled Automotive

* These parameters are characterized but not tested.

† Data in "Typ" column is at 5.0V, 25°C, unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.

The test conditions for all IDD measurements in active operation mode are:

OSC1 = external square wave, from rail to rail; all I/O pins tri-stated™, pulled to VDD,

MCLR = VDD; WDT enabled/disabled as specified.

3: The power-down current in SLEEP mode does not depend on the oscillator type. Power-down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD or VSS.

4: For RC osc configuration, current through Rext is not included. The current through the resistor can be estimated by the formula $I_r = V_{DD}/2R_{ext}$ (mA) with Rext in kΩ.

5: The Δ current is the additional current consumed when this peripheral is enabled. This current should be added to the base IDD or IPD measurement.

PIC16C64X & PIC16C66X

NOTES:

APPENDIX A: ENHANCEMENTS

The following are the list of enhancements over the PIC16C5X microcontroller family:

1. Instruction word length is increased to 14 bits. This allows larger page sizes both in program memory (4K now as opposed to 512 before) and register file (up to 176 bytes now versus 32 bytes before).
2. A PC high latch register (PCLATH) is added to handle program memory paging. PA2, PA1, PA0 bits are removed from STATUS register.
3. Data memory paging is slightly redefined. STATUS register is modified.
4. Four new instructions have been added: RETURN, RETFIE, ADDLW, and SUBLW. Two instructions TRIS and OPTION are being phased out although they are kept for compatibility with PIC16C5X.
5. OPTION and TRIS registers are made addressable.
6. Interrupt capability is added. Interrupt vector is at 0004h.
7. Stack size is increased to 8 deep.
8. Reset vector is changed to 0000h.
9. Reset of all registers is revisited. Six different reset (and wake-up) types are recognized. Registers are reset differently.
10. Wake up from SLEEP through interrupt is added.
11. Two separate timers, Oscillator Start-up Timer (OST) and Power-up Timer (PWRT) are included for more reliable power-up. These timers can be invoked selectively to avoid unnecessary delays on power-up and wake-up.
12. PORTB has weak pull-ups and interrupt on change feature.
13. Timer0 clock input, T0CKI pin is also a port pin (RA4/T0CKI) and has a TRIS bit.
14. FSR is made a full 8-bit register.
15. "In-circuit programming" is made possible. The user can program PIC16CXX devices using only five pins: VDD, VSS, VPP, RB6 (clock) and RB7 (data in/out).
16. PCON status register is added with a Power-on Reset status bit (\overline{POR}), a Brown-out Reset status bit (\overline{BOR}), a Parity Error Reset (\overline{PER}), and a Memory Parity Enable (MPEEN) bit.
17. Code protection scheme is enhanced such that portions of the program memory can be protected, while the remainder is unprotected.
18. PORTA inputs are now Schmitt Trigger inputs.
19. Brown-out Reset circuitry has been added.

APPENDIX B: COMPATIBILITY

To convert code written for PIC16C5X to PIC16CXX, the user should take the following steps:

1. Remove any program memory page select operations (PA2, PA1, PA0 bits) for CALL, GOTO.
2. Revisit any computed jump operations (write to PC or add to PC, etc.) to make sure page bits are set properly under the new scheme.
3. Eliminate any data memory page switching. Redefine data variables to reallocate them.
4. Verify all writes to STATUS, OPTION, and FSR registers since these have changed.
5. Change reset vector to 0000h.

PIC16C64X & PIC16C66X

APPENDIX E: PIC16/17 MICROCONTROLLERS

E.1 PIC14000 Devices

PIC14000	Clock		Memory			Peripherals				Features		
	Maximum Frequency of Operation (MHz)	EPROM Program Memory (Kx14 words)	Data Memory (bytes)	Timer Module(s)	Serial Ports (SPI/I ² C, USART)	Slope A/D Converter (high-res) Channels	Interrupt Sources	I/O Pins	Voltage Range (Volts)	In-Circuit Serial Programming	Additional On-chip Features	Packages
PIC14000	20	4K	192	TMR0 ADTMR	I ² C/ SMBus	14	11	22	2.7-6.0	Yes	Internal Oscillator, Bandgap Reference, Temperature Sensor, Calibration Factors, Low Voltage Detector, SLEEP, HIBERNATE, Comparators with Programmable References (2)	28-pin DIP, SOIC, SSOP (.300 mil)

PIC16C64X & PIC16C66X

E.6 PIC16C8X Family of Devices

	Clock			Memory			Peripherals		Features	
	Maximum Frequency of Operation (MHz)			Program Memory			Timer Modules			
	Flash	EEPROM	ROM	Data Memory (bytes)	Data EEPROM (bytes)	Interrupt Sources	I/O Pins	Voltage Range (Volts)	Packages	
PIC16C84	10	—	1K	—	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC
PIC16F84 ⁽¹⁾	10	1K	—	—	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC
PIC16CR84 ⁽¹⁾	10	—	—	1K	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC
PIC16F83 ⁽¹⁾	10	512	—	—	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC
PIC16CR83 ⁽¹⁾	10	—	—	512	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC

All PIC16/17 family devices have Power-on Reset, selectable Watchdog Timer, selectable code protect, and high I/O current capability.

All PIC16C8X family devices use serial programming with clock pin RB6 and data pin RB7.

Note 1: Please contact your local sales office for availability of these devices.
