What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

1 Introduction

This datasheet provides the description of the STM32F205xx and STM32F207xx lines of microcontrollers. For more details on the whole STMicroelectronics STM32 family, refer to *Section 2.1: Full compatibility throughout the family*.

The STM32F205xx and STM32F207xx datasheet should be read in conjunction with the STM32F20x/STM32F21x reference manual. They will be referred to as STM32F20x devices throughout the document.

For information on programming, erasing and protection of the internal Flash memory, refer to the STM32F20x/STM32F21x Flash programming manual (PM0059).

The reference and Flash programming manuals are both available from the STMicroelectronics website *www.st.com*.

Package		LQFP100	LQFP144	LQFP176/ UFBGA176

1. For the LQFP100 package, only FSMC Bank1 or Bank2 are available. Bank1 can only support a multiplexed NOR/PSRAM memory using the NE1 Chip Select. Bank2 can only support a 16- or 8-bit NAND Flash memory using the NCE2 Chip Select. The interrupt line cannot be used since Port G is not available in this package.
2. The SPI2 and SPI3 interfaces give the flexibility to work in an exclusive way in either the SPI mode or the I2S audio mode.
3. On devices in WLCSP64+2 package, if IRROFF is set to V_{DD}, the supply voltage can drop to 1.7 V when the device operates in the 0 to 70 °C temperature range using an external power supply supervisor (see *Section 3.16*).

3.4 Embedded Flash memory

The STM32F20x devices embed a 128-bit wide Flash memory of 128 Kbytes, 256 Kbytes, 512 Kbytes, 768 Kbytes or 1 Mbyte available for storing programs and data.

The devices also feature 512 bytes of OTP memory that can be used to store critical user data such as Ethernet MAC addresses or cryptographic keys.

3.5 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from a 32-bit data word and a fixed generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a software signature during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

3.6 Embedded SRAM

All STM32F20x products embed:

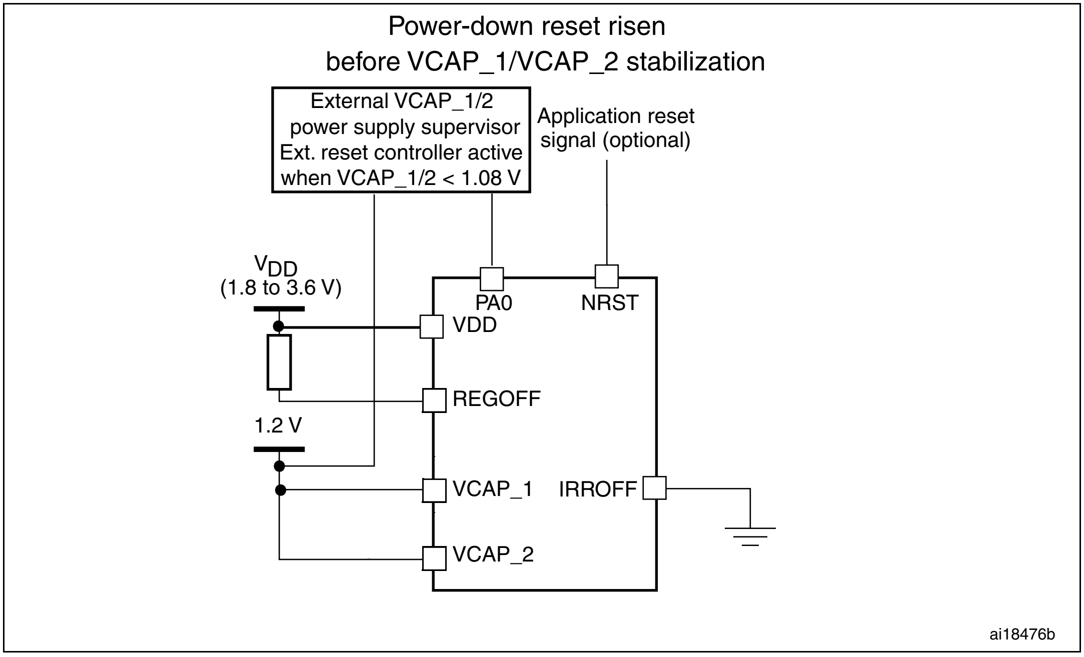
- Up to 128 Kbytes of system SRAM accessed (read/write) at CPU clock speed with 0 wait states
- 4 Kbytes of backup SRAM.

  The content of this area is protected against possible unwanted write accesses, and is retained in Standby or V_{BAT} mode.

3.7 Multi-AHB bus matrix

The 32-bit multi-AHB bus matrix interconnects all the masters (CPU, DMAs, Ethernet, USB HS) and the slaves (Flash memory, RAM, FSMC, AHB and APB peripherals) and ensures a seamless and efficient operation even when several high-speed peripherals work simultaneously.

Figure 6. Regulator OFF/internal reset ON



The following conditions must be respected:

- V_{DD} should always be higher than V_{CAP_1} and V_{CAP_2} to avoid current injection between power domains.
- If the time for V_{CAP_1} and V_{CAP_2} to reach 1.08 V is faster than the time for V_{DD} to reach 1.8 V, then PA0 should be kept low to cover both conditions: until V_{CAP_1} and V_{CAP_2} reach 1.08 V and until V_{DD} reaches 1.8 V (see *Figure 8*).
- Otherwise, If the time for V_{CAP_1} and V_{CAP_2} to reach 1.08 V is slower than the time for V_{DD} to reach 1.8 V, then PA0 should be asserted low externally (see *Figure 9*).
- If V_{CAP_1} and V_{CAP_2} go below 1.08 V and V_{DD} is higher than 1.8 V, then a reset must be asserted on PA0 pin.

Regulator OFF/internal reset OFF

On WLCSP64+2 package, this mode activated by connecting REGOFF to V_{SS} and IRROFF to V_{DD}. IRROFF cannot be activated in conjunction with REGOFF. This mode is available only on the WLCSP64+2 package. It allows to supply externally a 1.2 V voltage source through V_{CAP_1} and V_{CAP_2} pins. In this mode, the integrated power-on reset (POR)/ power-down reset (PDR) circuitry is disabled.

An external power supply supervisor should monitor both the external 1.2 V and the external V_{DD} supply voltage, and should maintain the device in reset mode as long as they remain below a specified threshold. The V_{DD} specified threshold, below which the device must be maintained under reset, is 1.8 V. This supply voltage can drop to 1.7 V when the device operates in the 0 to 70 °C temperature range. A comprehensive set of power-saving modes allows the design of low-power applications.

Table 15. Limitations depending on the operating power supply range

Operating power supply range	ADC operation	Maximum Flash memory access frequency ($f_{Flashmax}$)	Number of wait states at maximum CPU frequency (f_{CPUmax}= 120 MHz)[1]	I/O operation	FSMC_CLK frequency for synchronous accesses	Possible Flash memory operations
V_{DD} =1.8 to 2.1 V[2]	Conversion time up to 1 Msps	16 MHz with no Flash memory wait state	7[3]	– Degraded speed performance – No I/O compensation	Up to 30 MHz	8-bit erase and program operations only
V_{DD} = 2.1 to 2.4 V	Conversion time up to 1 Msps	18 MHz with no Flash memory wait state	6[3]	– Degraded speed performance – No I/O compensation	Up to 30 MHz	16-bit erase and program operations
V_{DD} = 2.4 to 2.7 V	Conversion time up to 2 Msps	24 MHz with no Flash memory wait state	4[3]	– Degraded speed performance – I/O compensation works	Up to 48 MHz	16-bit erase and program operations
V_{DD} = 2.7 to 3.6 V[4]	Conversion time up to 2 Msps	30 MHz with no Flash memory wait state	3[3]	– Full-speed operation – I/O compensation works	– Up to 60 MHz when V_{DD} = 3.0 to 3.6 V – Up to 48 MHz when V_{DD} = 2.7 to 3.0 V	32-bit erase and program operations

1. The number of wait states can be reduced by reducing the CPU frequency (see *Figure 21*).
2. On devices in WLCSP64+2 package, if IRROFF is set to V_{DD}, the supply voltage can drop to 1.7 V when the device operates in the 0 to 70 °C temperature range using an external power supply supervisor (see *Section 3.16*).
3. Thanks to the ART accelerator and the 128-bit Flash memory, the number of wait states given here does not impact the execution speed from Flash memory since the ART accelerator allows to achieve a performance equivalent to 0 wait state program execution.
4. The voltage range for OTG USB FS can drop down to 2.7 V. However it is degraded between 2.7 and 3 V.
