What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	e200z0h
Core Size	32-Bit Single-Core
Speed	64MHz
Connectivity	CANbus, I²C, LINbus, SCI, SPI
Peripherals	DMA, POR, PWM, WDT
Number of I/O	77
Program Memory Size	768KB (768K x 8)
Program Memory Type	FLASH
EEPROM Size	64K x 8
RAM Size	64K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 7x10b, 5x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LQFP
Supplier Device Package	100-LQFP (14x14)

[4] All WKUP pins also support external interrupt capability. See the WKPU chapter of the *MPC5606BK Microcontroller Reference Manual* for further details.

[5] NMI has higher priority than alternate function. When NMI is selected, the PCR.AF field is ignored.

[6] "Not applicable" because these functions are available only while the device is booting. See the BAM chapter of the *MPC5606BK Microcontroller Reference Manual* for details.

[7] Value of PCR.IBE bit must be 0.

[8] Out of reset all the functional pins except PC[0:1] and PH[9:10] are available to the user as GPIO.
PC[0:1] are available as JTAG pins (TDI and TDO respectively).
PH[9:10] are available as JTAG pins (TCK and TMS respectively).
It is up to the user to configure these pins as GPIO when needed.

[9] PC[1] is a fast/medium pad but is in medium configuration by default. This pad is in Alternate Function 2 mode after reset which has TDO functionality. The reset value of PCR.OBE is 1, but this setting has no impact as long as this pad stays in AF2 mode. After configuring this pad as GPIO (PCR.PA = 0), output buffer is enabled as reset value of PCR.OBE = 1.

[10] Not available in 100LQFP package.

3 Electrical characteristics

This section contains electrical characteristics of the device as well as temperature and power considerations.

This product contains devices to protect the inputs against damage due to high static voltages. However, it is advisable to take precautions to avoid application of any voltage higher than the specified maximum rated voltages.

To enhance reliability, unused inputs can be driven to an appropriate logic voltage level (V_{DD} or V_{SS}). This could be done by the internal pull-up and pull-down, which is provided by the product for most general purpose pins.

The parameters listed in the following tables represent the characteristics of the device and its demands on the system.

In the tables where the device logic provides signals with their respective timing characteristics, the symbol "CC" for Controller Characteristics is included in the Symbol column.

In the tables where the external system must provide signals with their respective timing characteristics to the device, the symbol "SR" for System Requirement is included in the Symbol column.

3.1 Parameter classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the classifications listed in Table 4 are used and the parameters are tagged accordingly in the tables where appropriate.

Table 9. Recommended operating conditions (3.3 V) (continued)

T_{A} M-Grade Part	SR	Ambient temperature under bias	f_{CPU} < 64 MHz[7]	–40	125	
T_{J} M-Grade Part	SR	Junction temperature under bias	—	–40	150	

1 100 nF capacitance needs to be provided between each V_{DD}/V_{SS} pair.

2 330 nF capacitance needs to be provided between each V_{DD_LV}/V_{SS_LV} supply pair.

3 470 nF capacitance needs to be provided between V_{DD_BV} and the nearest V_{SS_LV} (higher value may be needed depending on external regulator characteristics). Supply ramp slope on VDD_BV should always be faster or equal to slope of VDD_HV. Otherwise, device may enter regulator bypass mode if slope on VDD_BV is slower.

4 100 nF capacitance needs to be provided between V_{DD_ADC}/V_{SS_ADC} pair.

5 Full electrical specification cannot be guaranteed when voltage drops below 3.0 V. In particular, ADC electrical characteristics and I/O DC electrical specification may not be guaranteed. When voltage drops below V_{LVDHVL}, the device is reset.

6 Guaranteed by device validation

7 This frequency includes the 4% frequency modulation guard band.

Therefore it is recommended that the user apply EMC software optimization and prequalification tests in relation with the EMC level requested for the application.

- Software recommendations – The software flowchart must include the management of runaway conditions such as:
  - Corrupted program counter
  - Unexpected reset
  - Critical data corruption (control registers...)
- Prequalification trials – Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the reset pin or the oscillator pins for 1 second.

  To complete these trials, ESD stress can be applied directly on the device. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring.

3.11.2 Electromagnetic interference (EMI)

The product is monitored in terms of emission based on a typical application. This emission test conforms to the IEC61967-1 standard, which specifies the general conditions for EMI measurements.

2 For information on conducted emission and susceptibility measurement (norm IEC 61967-4), please contact your local marketing representative.

3.11.3 Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity.

3.11.3.1 Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts×(n + 1) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard.

2 PLLIN clock retrieved directly from FXOSC clock. Input characteristics are granted when oscillator is used in functional mode. When bypass mode is used, oscillator input clock should verify f_{PLLIN} and Δ_{PLLIN}.

3 Frequency modulation is considered ± 4%.

4 f_{CPU} 64 MHz can be achieved only at up to 105 °C.

5 Short term jitter is measured on the clock rising edge at cycle *n* and *n* + 4.

3.15 Fast internal RC oscillator (16 MHz) electrical characteristics

The device provides a 16 MHz main internal RC oscillator. This is used as the default clock at the power-up of the device.

Table 38. Fast internal RC oscillator (16 MHz) electrical characteristics

6 Revision history

Table 46. Revision history

Revision	Date	Description of changes
1	22 Apr 2011	Initial release.
2	15 May 2013	Changed device number to MPC5606BK. In Table 2 (Functional port pins), updated PA[11] AF2, PD[13] AF2, and PH[11] AF3 I/O direction to “I/O”. In Table 3 (Pad types), corrected “Fast” in the “S” row to “Slow.” In Table 5 (PAD3V5V field description), updated footnote 2. In Table 6 (OSCILLATOR_MARGIN field description), updated footnote 2. Inserted Section 3.2.3, NVUSRO[WATCHDOG_EN] field description. In Table 8 (Absolute maximum ratings), Table 9 (Recommended operating conditions (3.3 V)), and Table 10 (Recommended operating conditions (5.0 V)), corrected the parameter description for V_{DD_ADC} to “Voltage on VDD_HV_ADC0, VDD_HV_ADC1 (ADC reference) with respect to ground (V_{SS})” In Section 3.6.1, I/O pad types bullet item, removed Nexus reference. In Table 12 (I/O input DC electrical characteristics), added specifications for 85 °C. In Table 13 (I/O pull-up/pull-down DC electrical characteristics), Table 14 (SLOW configuration output buffer electrical characteristics), Table 15 (MEDIUM configuration output buffer electrical characteristics), and Table 16 (FAST configuration output buffer electrical characteristics), changed sentence in footnote 2 to “All pads but RESET are configured in input or in high impedance state.” In Table 15 (MEDIUM configuration output buffer electrical characteristics), for V_{OL}, changed I_{OH} to I_{OL}. Updated Table 20 (I/O weight). In Table 21 (Reset electrical characteristics) changed sentence in footnote 4 to “All pads but RESET are configured in input or in high impedance state.” in Table 22 (Voltage regulator electrical characteristics), corrected the maximum value for I_{DD_BV} in Table 22 (Voltage regulator electrical characteristics) to 300 mA. In Table 23 (Low voltage monitor electrical characteristics), changed V_{PORUP} classification tag from “P” (Production testing guaranteed) to “D” (Design simulation). Changed $V_{LVDHV3BH}$ classification tag from “P” (Production testing guaranteed) to “T” (Design characterization). In Table 23 (Low voltage monitor electrical characteristics), changed $V_{LVDHV3L}$, $V_{LVDHV3BL}$ minimums from 2.7 V to 2.6 V.
