
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e300
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	400MHz
Co-Processors/DSP	-
RAM Controllers	DDR
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (2)
SATA	-
USB	USB 2.0 + PHY (2)
Voltage - I/O	2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	-
Package / Case	620-BBGA Exposed Pad
Supplier Device Package	620-HBGA (29x29)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8347vragd

- Up to four physical banks (chip selects), each bank up to 1 Gbyte independently addressable
- DRAM chip configurations from 64 Mbits to 1 Gbit with ×8/×16 data ports
- Full error checking and correction (ECC) support
- Support for up to 16 simultaneous open pages (up to 32 pages for DDR2)
- Contiguous or discontiguous memory mapping
- Read-modify-write support
- Sleep-mode support for SDRAM self refresh
- Auto refresh
- On-the-fly power management using CKE
- Registered DIMM support
- 2.5-V SSTL2 compatible I/O for DDR1, 1.8-V SSTL2 compatible I/O for DDR2

- Dual three-speed (10/100/1000) Ethernet controllers (TSECs)
  - Dual controllers designed to comply with IEEE 802.3™, 802.3u™, 820.3x™, 802.3z™, 802.3ac™ standards
  - Ethernet physical interfaces:
    - 1000 Mbps IEEE Std. 802.3 GMII/RGMII, IEEE Std. 802.3z TBI/RTBI, full-duplex
    - 10/100 Mbps IEEE Std. 802.3 MII full- and half-duplex
  - Buffer descriptors are backward-compatible with MPC8260 and MPC860T 10/100 programming models
  - 9.6-Kbyte jumbo frame support
  - RMON statistics support
  - Internal 2-Kbyte transmit and 2-Kbyte receive FIFOs per TSEC module
  - MII management interface for control and status
  - Programmable CRC generation and checking
- PCI interface
  - Designed to comply with *PCI Specification Revision 2.3*
  - Data bus width:
    - 32-bit data PCI interface operating at up to 66 MHz
  - PCI 3.3-V compatible
  - PCI host bridge capabilities
  - PCI agent mode on PCI interface
  - PCI-to-memory and memory-to-PCI streaming
  - Memory prefetching of PCI read accesses and support for delayed read transactions
  - Posting of processor-to-PCI and PCI-to-memory writes
  - On-chip arbitration supporting five masters on PCI
  - Accesses to all PCI address spaces
  - Parity supported
  - Selectable hardware-enforced coherency

Table 4. MPC8347EA Power Dissipation[1] (continued)

	Core Frequency (MHz)	CSB Frequency (MHz)	Typical at T_J = 65	Typical[2,3]	Maximum[4]	Unit
TBGA	333	333	2.0	3.0	3.2	W
		166	1.8	2.8	2.9	W
	400	266	2.1	3.0	3.3	W
		133	1.9	2.9	3.1	W
	450	300	2.3	3.2	3.5	W
		150	2.1	3.0	3.2	W
	500	333	2.4	3.3	3.6	W
		166	2.2	3.1	3.4	W
	533	266	2.4	3.3	3.6	W
		133	2.2	3.1	3.4	W
	667[5,6]	333	3.5	4.6	5	W

1 The values do not include I/O supply power (OV_{DD}, LV_{DD}, GV_{DD}) or AV_{DD}. For I/O power values, see Table 5.

2 Typical power is based on a voltage of V_{DD} = 1.2 V, a junction temperature of T_J = 105°C, and a Dhrystone benchmark application.

3 Thermal solutions may need to design to a value higher than typical power based on the end application, T_A target, and I/O power.

4 Maximum power is based on a voltage of V_{DD} = 1.2 V, worst case process, a junction temperature of T_J = 105°C, and an artificial smoke test.

5 Typical power is based on a voltage of V_{DD} = 1.3 V, a junction temperature of T_J = 105°C, and a Dhrystone benchmark application.

6 Maximum power is based on a voltage of V_{DD} = 1.3 V, worst case process, a junction temperature of T_J = 105°C, and an artificial smoke test.

Table 20. DDR and DDR2 SDRAM Output AC Timing Specifications (continued)

At recommended operating conditions with GV_{DD} of (1.8 or 2.5 V) ± 5%.

Parameter	Symbol [1]	Min	Max	Unit	Notes
266 MHz		1100	—		
200 MHz		1200	—		
MDQS preamble start	t_{DDKHMP}	$-0.5 \times t_{MCK} - 0.6$	$-0.5 \times t_{MCK} + 0.6$	ns	6
MDQS epilogue end	t_{DDKHME}	–0.6	0.6	ns	6

Notes:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. Output hold time can be read as DDR timing (DD) from the rising or falling edge of the reference clock (KH or KL) until the output goes invalid (AX or DX). For example, t_{DDKHAS} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes from the high (H) state until outputs (A) are set up (S) or output valid time. Also, t_{DDKLDX} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes low (L) until data outputs (D) are invalid (X) or data output hold time.
2. All MCK/$\overline{\text{MCK}}$ referenced measurements are made from the crossing of the two signals ±0.1 V.
3. ADDR/CMD includes all DDR SDRAM output signals except MCK/$\overline{\text{MCK}}$, $\overline{\text{MCS}}$, and MDQ/MECC/MDM/MDQS. For the ADDR/CMD setup and hold specifications, it is assumed that the clock control register is set to adjust the memory clocks by 1/2 applied cycle.
4. t_{DDKHMH} follows the symbol conventions described in note 1. For example, t_{DDKHMH} describes the DDR timing (DD) from the rising edge of the MCK(n) clock (KH) until the MDQS signal is valid (MH). t_{DDKHMH} can be modified through control of the DQSS override bits in the TIMING_CFG_2 register and is typically set to the same delay as the clock adjust in the CLK_CNTL register. The timing parameters listed in the table assume that these two parameters are set to the same adjustment value. See the *MPC8349EA PowerQUICC II Pro Integrated Host Processor Family Reference Manual* for the timing modifications enabled by use of these bits.
5. Determined by maximum possible skew between a data strobe (MDQS) and any corresponding bit of data (MDQ), ECC (MECC), or data mask (MDM). The data strobe should be centered inside the data eye at the pins of the microprocessor.
6. All outputs are referenced to the rising edge of MCK(n) at the pins of the microprocessor. Note that t_{DDKHMP} follows the symbol conventions described in note 1.

Figure 6 shows the DDR SDRAM output timing for the MCK to MDQS skew measurement (t_{DDKHMH}).

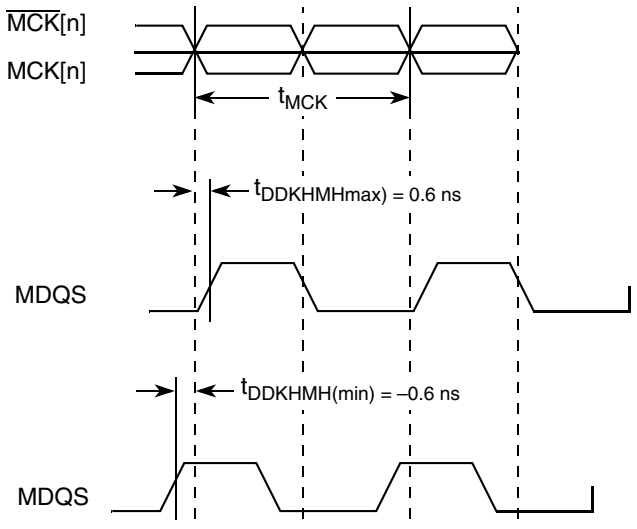

Figure 6. Timing Diagram for t_{DDKHMH}

Table 28. MII Receive AC Timing Specifications (continued)

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
RX_CLK clock rise (20%–80%)	t_{MRXR}	1.0	—	4.0	ns
RX_CLK clock fall time (80%–20%)	t_{MRXF}	1.0	—	4.0	ns

Note:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MRDVKH} symbolizes MII receive timing (MR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MRX} clock reference (K) going to the high (H) state or setup time. Also, t_{MRDXKL} symbolizes MII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{MRX} clock reference (K) going to the low (L) state or hold time. In general, the clock reference symbol is based on three letters representing the clock of a particular function. For example, the subscript of t_{MRX} represents the MII (M) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

Figure 12 provides the AC test load for TSEC.

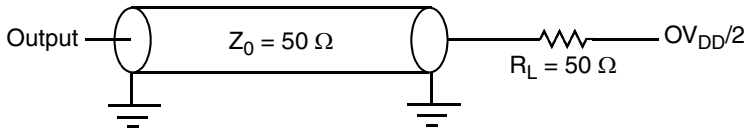

Figure 12. TSEC AC Test Load

Figure 13 shows the MII receive AC timing diagram.

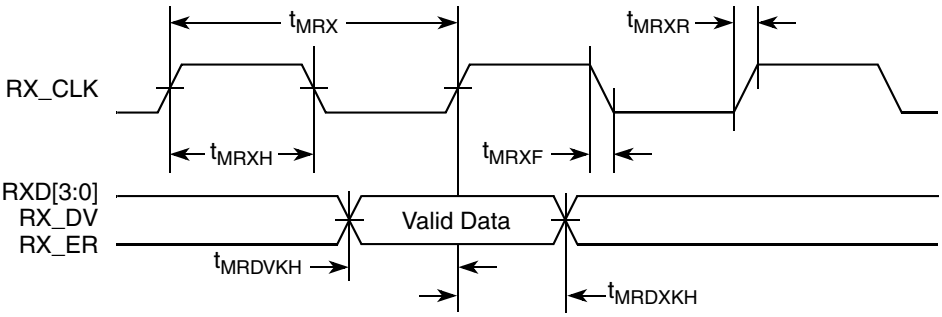

Figure 13. MII Receive AC Timing Diagram

8.2.3 TBI AC Timing Specifications

This section describes the TBI transmit and receive AC timing specifications.

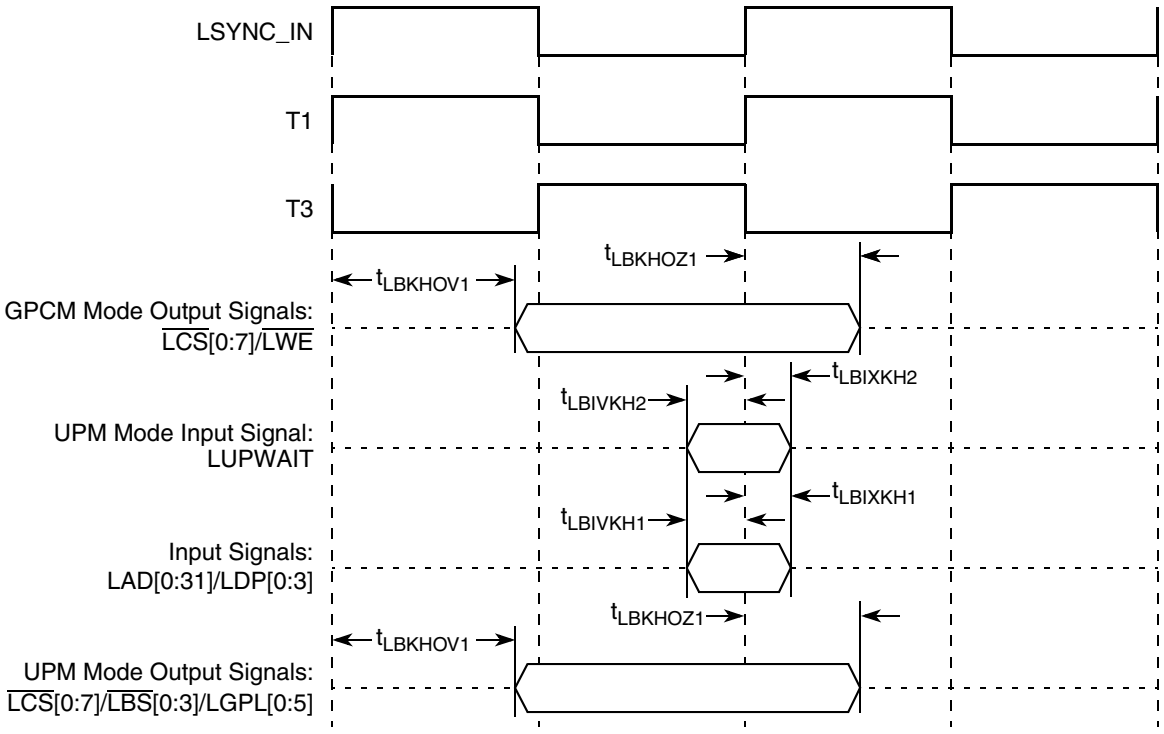

Figure 23. Local Bus Signals, GPCM/UPM Signals for LCCR[CLKDIV] = 2 (DLL Enabled)

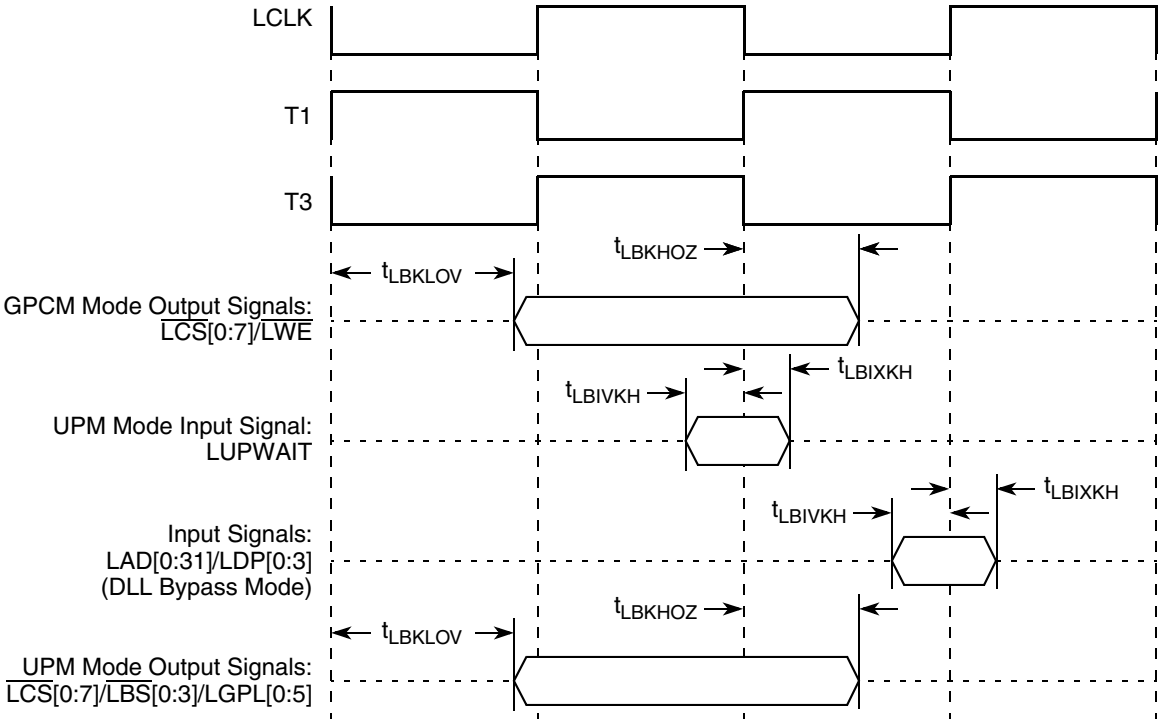

Figure 24. Local Bus Signals, GPCM/UPM Signals for LCCR[CLKDIV] = 2 (DLL Bypass Mode)

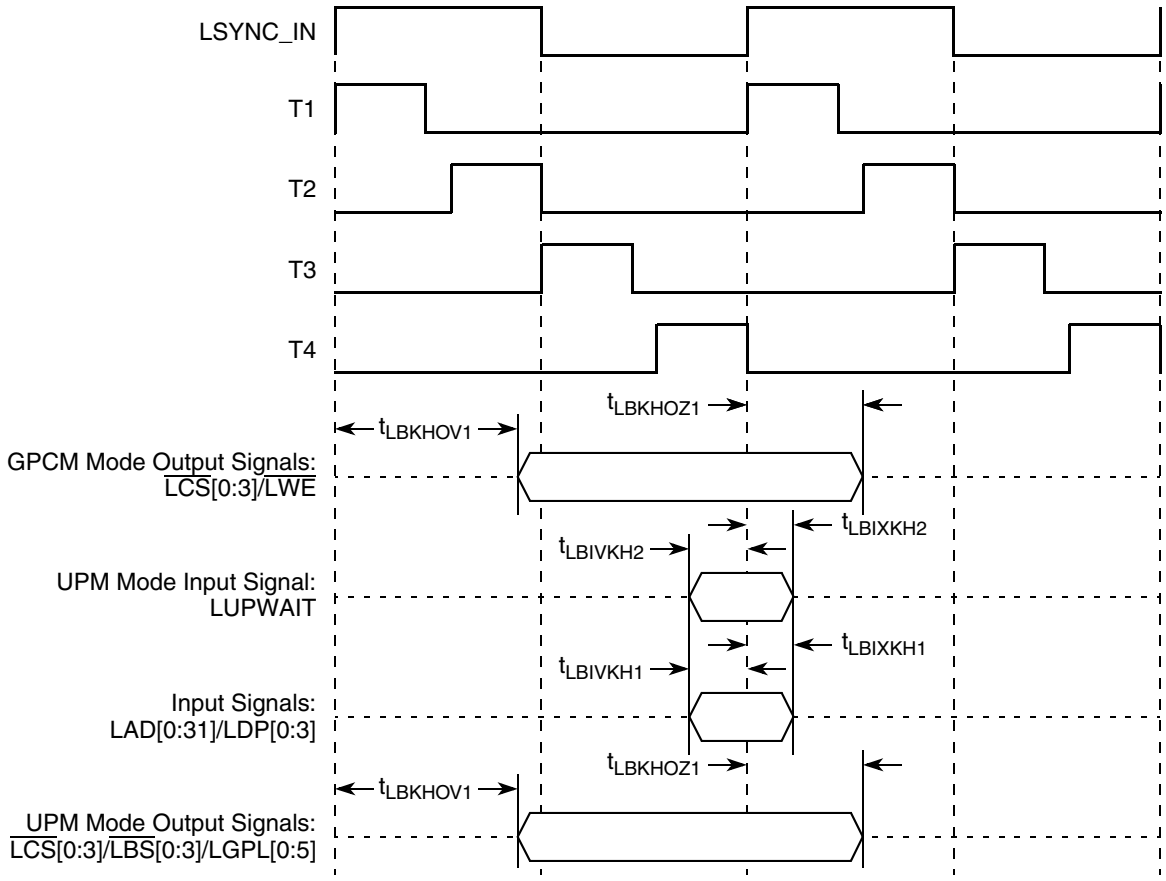

Figure 26. Local Bus Signals, GPCM/UPM Signals for LCCR[CLKDIV] = 4 (DLL Enabled)

11 JTAG

This section describes the DC and AC electrical specifications for the IEEE Std. 1149.1 (JTAG) interface of the MPC8347EA.

11.1 JTAG DC Electrical Characteristics

Table 40 provides the DC electrical characteristics for the IEEE Std. 1149.1 (JTAG) interface of the MPC8347EA.

Table 40. JTAG Interface DC Electrical Characteristics

Parameter	Symbol	Condition	Min	Max	Unit
Input high voltage	V_{IH}	—	OV_{DD} – 0.3	OV_{DD} + 0.3	V
Input low voltage	V_{IL}	—	–0.3	0.8	V
Input current	I_{IN}	—	—	±5	μA
Output high voltage	V_{OH}	I_{OH} = –8.0 mA	2.4	—	V

Table 41. JTAG AC Timing Specifications (Independent of CLKIN)[1] (continued)

At recommended operating conditions (see Table 2).

Parameter	Symbol[2]	Min	Max	Unit	Notes
JTAG external clock to output high impedance: Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 2 2	 19 9	ns	5, 6

Notes:

1. All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50 Ω load (see Figure 18). Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
2. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. In general, the clock reference symbol is based on three letters representing the clock of a particular function. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
3. $\overline{\text{TRST}}$ is an asynchronous level sensitive signal. The setup time is for test purposes only.
4. Non-JTAG signal input timing with respect to t_{TCLK}.
5. Non-JTAG signal output timing with respect to t_{TCLK}.
6. Guaranteed by design and characterization.

Figure 27 provides the AC test load for TDO and the boundary-scan outputs of the MPC8347EA.

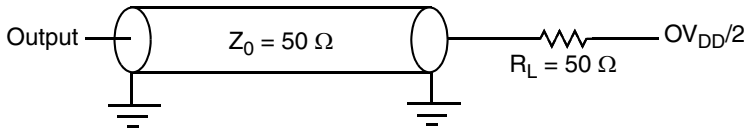

Figure 27. AC Test Load for the JTAG Interface

Figure 28 provides the JTAG clock input timing diagram.

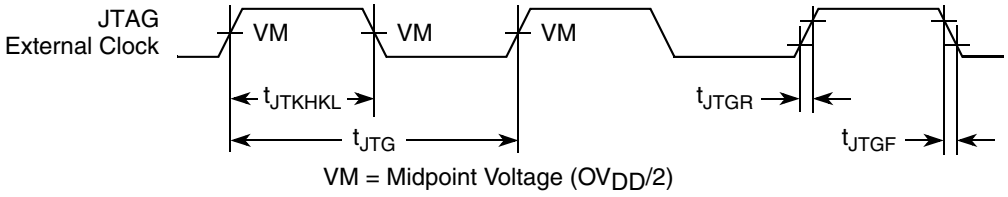

Figure 28. JTAG Clock Input Timing Diagram

Figure 29 provides the $\overline{\text{TRST}}$ timing diagram.

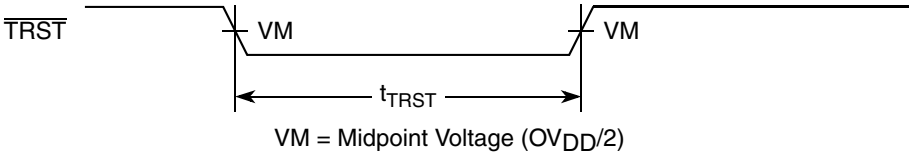

Figure 29. $\overline{\text{TRST}}$ Timing Diagram

Table 45. PCI AC Timing Specifications at 66 MHz[1] (continued)

Parameter	Symbol[2]	Min	Max	Unit	Notes
Input hold from clock	t_{PCIXKH}	0	—	ns	3, 5

Notes:
1. PCI timing depends on M66EN and the ratio between PCI1/PCI2. Refer to the PCI chapter of the reference manual for a description of M66EN.
2. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{PCIVKH} symbolizes PCI timing (PC) with respect to the time the input signals (I) reach the valid state (V) relative to the PCI_SYNC_IN clock, t_{SYS}, reference (K) going to the high (H) state or setup time. Also, t_{PCRHFV} symbolizes PCI timing (PC) with respect to the time hard reset (R) went high (H) relative to the frame signal (F) going to the valid (V) state.
3. See the timing measurement conditions in the *PCI 2.3 Local Bus Specifications*.
4. For active/float timing measurements, the Hi-Z or off-state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
5. Input timings are measured at the pin.

Table 46 provides the PCI AC timing specifications at 33 MHz.

Table 46. PCI AC Timing Specifications at 33 MHz

Parameter	Symbol[1]	Min	Max	Unit	Notes
Clock to output valid	t_{PCKHOV}	—	11	ns	2
Output hold from clock	t_{PCKHOX}	2	—	ns	2
Clock to output high impedance	t_{PCKHOZ}	—	14	ns	2, 3
Input setup to clock	t_{PCIVKH}	3.0	—	ns	2, 4
Input hold from clock	t_{PCIXKH}	0	—	ns	2, 4

Notes:
1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{PCIVKH} symbolizes PCI timing (PC) with respect to the time the input signals (I) reach the valid state (V) relative to the PCI_SYNC_IN clock, t_{SYS}, reference (K) going to the high (H) state or setup time. Also, t_{PCRHFV} symbolizes PCI timing (PC) with respect to the time hard reset (R) went high (H) relative to the frame signal (F) going to the valid (V) state.
2. See the timing measurement conditions in the *PCI 2.3 Local Bus Specifications*.
3. For active/float timing measurements, the Hi-Z or off-state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
4. Input timings are measured at the pin.

Figure 34 provides the AC test load for PCI.

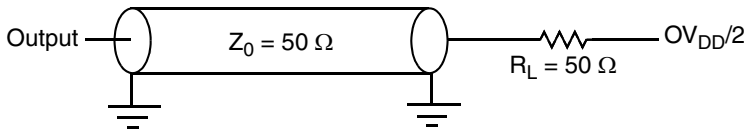

Figure 34. PCI AC Test Load

Pitch	1.00 mm
Module height (typical)	1.46 mm
Solder balls	62 Sn/36 Pb/2 Ag (ZU package) 96.5 Sn/3.5Ag (VV package)
Ball diameter (typical)	0.64 mm

18.3 Package Parameters for the MPC8347EA PBGA

The package parameters are as provided in the following list. The package type is 29 mm × 29 mm, 620 plastic ball grid array (PBGA).

Package outline	29 mm × 29 mm
Interconnects	620
Pitch	1.00 mm
Module height (maximum)	2.46 mm
Module height (typical)	2.23 mm
Module height (minimum)	2.00 mm
Solder balls	62 Sn/36 Pb/2 Ag (ZQ package) 96.5 Sn/3.5Ag (VR package)
Ball diameter (typical)	0.60 mm

18.5 Pinout Listings

Table 55 provides the pinout listing for the MPC8347EA, 672 TBGA package.

Table 56. MPC8347EA (PBGA) Pinout Listing (continued)

Signal	Package Pin Number	Pin Type	Power Supply	Notes
Thermal Management				
THERM0	B15	I	—	8
Power and Ground Signals				
$AV_{DD}1$	C15	Power for e300 PLL (1.2 V) nominal, 1.3 V for 667 MHz)	$AV_{DD}1$	—
$AV_{DD}2$	U1	Power for system PLL (1.2 V) nominal, 1.3 V for 667 MHz)	$AV_{DD}2$	—
$AV_{DD}3$	AF9	Power for DDR DLL (1.2 V nominal, 1.3 V for 667 MHz)		—
$AV_{DD}4$	U2	Power for LBIU DLL (1.2 V nominal, 1.3 V for 667 MHz)	$AV_{DD}4$	—
GND	A2, B1, B2, D10, D18, E6, E14, E22, F9, F12, F15, F18, F21, F24, G5, H6, J23, L4, L6, L12, L13, L14, L15, L16, L17, M11, M12, M13, M14, M15, M16, M17, M18, M23, N11, N12, N13, N14, N15, N16, N17, N18, P6, P11, P12, P13, P14, P15, P16, P17, P18, P24, R5, R11, R12, R13, R14, R15, R16, R17, R18, R23, T11, T12, T13, T14, T15, T16, T17, T18, U6, U11, U12, U13, U14, U15, U16, U17, U18, V12, V13, V14, V15, V16, V17, V23, V25, W4, Y6, AA23, AB24, AC5, AC8, AC11, AC14, AC17, AC20, AD9, AD15, AD21, AE12, AE18, AF3, AF26	—	—	—
GV_{DD}	U9, V9, W10, W19, Y11, Y12, Y14, Y15, Y17, Y18, AA6, AB5, AC9, AC12, AC15, AC18, AC21, AC24, AD6, AD8, AD14, AD20, AE5, AE11, AE17, AG2, AG27	Power for DDR DRAM I/O voltage (2.5 V)	GV_{DD}	—

Table 56. MPC8347EA (PBGA) Pinout Listing (continued)

Signal	Package Pin Number	Pin Type	Power Supply	Notes
$LV_{DD}1$	U20, W25	Power for three-speed Ethernet #1 and for Ethernet management interface I/O (2.5 V, 3.3 V)	$LV_{DD}1$	—
$LV_{DD}2$	V20, Y23	Power for three-speed Ethernet #2 I/O (2.5 V, 3.3 V)	$LV_{DD}2$	—
V_{DD}	J11, J12, J15, K10, K11, K12, K13, K14, K15, K16, K17, K18, K19, L10, L11, L18, L19, M10, M19, N10, N19, P9, P10, P19, R10, R19, R20, T10, T19, U10, U19, V10, V11, V18, V19, W11, W12, W13, W14, W15, W16, W17, W18	Power for core (1.2 V)	V_{DD}	—
OV_{DD}	B27, D3, D11, D19, E15, E23, F5, F8, F11, F14, F17, F20, G24, H23, H24, J6, J14, J17, J18, K4, L9, L20, L23, L25, M6, M9, M20, P5, P20, P23, R6, R9, R24, U23, V4, V6	PCI, 10/100 Ethernet, and other standard (3.3 V)	OV_{DD}	—
MVREF1	AF19	I	DDR reference voltage	—
MVREF2	AE10	I	DDR reference voltage	—
No Connection				
NC	V1, V2, V5	—	—	—

Notes:
1. This pin is an open-drain signal. A weak pull-up resistor (1 kΩ) should be placed on this pin to OV_{DD}.
2. This pin is an open-drain signal. A weak pull-up resistor (2–10 kΩ) should be placed on this pin to OV_{DD}.
3. During reset, this output is actively driven rather than three-stated.
4. These JTAG pins have weak internal pull-up P-FETs that are always enabled.
5. This pin should have a weak pull-up if the chip is in PCI host mode. Follow the PCI specifications.
6. This pin must always be tied to GND.
7. This pin must always be left not connected.
8. Thermal sensitive resistor.
9. It is recommended that MDIC0 be tied to GRD using an 18 Ω resistor and MDIC1 be tied to DDR power using an 18 Ω resistor.
10. TSEC1_TXD[3] is required an external pull-up resistor. For proper functionality of the device, this pin must be pulled up or actively driven high during a hard reset. No external pull-down resistors are allowed to be attached to this net.
11. A weak pull-up resistor (2–10 kΩ) should be placed on this pin to LV_{DD1}.
12. For systems that boot from local bus (GPCM)-controlled NOR flash, a pullup on LGPL4 is required.

As shown in Figure 42, the primary clock input (frequency) is multiplied up by the system phase-locked loop (PLL) and the clock unit to create the coherent system bus clock (*csb_clk*), the internal clock for the DDR controller (*ddr_clk*), and the internal clock for the local bus interface unit (*lbiu_clk*).

The *csb_clk* frequency is derived from a complex set of factors that can be simplified into the following equation:

$$csb\_clk = \{PCI\_SYNC\_IN \times (1 + CFG\_CLKIN\_DIV)\} \times SPMF$$

In PCI host mode, PCI_SYNC_IN × (1 + CFG_CLKIN_DIV) is the CLKIN frequency.

The *csb_clk* serves as the clock input to the e300 core. A second PLL inside the e300 core multiplies the *csb_clk* frequency to create the internal clock for the e300 core (*core_clk*). The system and core PLL multipliers are selected by the SPMF and COREPLL fields in the reset configuration word low (RCWL), which is loaded at power-on reset or by one of the hard-coded reset options. See the chapter on reset, clocking, and initialization in the *MPC8349EA Reference Manual* for more information on the clock subsystem.

The internal *ddr_clk* frequency is determined by the following equation:

$$ddr\_clk = csb\_clk \times (1 + RCWL[DDRCM])$$

ddr_clk is not the external memory bus frequency; *ddr_clk* passes through the DDR clock divider (÷2) to create the differential DDR memory bus clock outputs (MCK and $\overline{\text{MCK}}$). However, the data rate is the same frequency as *ddr_clk*.

The internal *lbiu_clk* frequency is determined by the following equation:

$$lbiu\_clk = csb\_clk \times (1 + RCWL[LBIUCM])$$

lbiu_clk is not the external local bus frequency; *lbiu_clk* passes through the LBIU clock divider to create the external local bus clock outputs (LSYNC_OUT and LCLK[0:2]). The LBIU clock divider ratio is controlled by LCCR[CLKDIV].

In addition, some of the internal units may have to be shut off or operate at lower frequency than the *csb_clk* frequency. Those units have a default clock ratio that can be configured by a memory-mapped register after the device exits reset. Table 57 specifies which units have a configurable clock frequency.

Table 57. Configurable Clock Units

Unit	Default Frequency	Options
TSEC1	*csb_clk/3*	Off, *csb_clk, csb_clk/2, csb_clk/3*
TSEC2, I^2C1	*csb_clk/3*	Off, *csb_clk, csb_clk/2, csb_clk/3*
Security core	*csb_clk/3*	Off, *csb_clk,* csb_clk/2, *csb_clk/3*
USB DR, USB MPH	*csb_clk/3*	Off, csb_clk, csb_clk/2, *csb_clk/3*
PCI and DMA complex	*csb_clk*	Off, *csb_clk*

Table 58 provides the operating frequencies for the MPC8347EA TBGA under recommended operating conditions (see Table 2). All frequency combinations shown in the table below may not be available. Maximum operating frequencies depend on the part ordered, see Section 22.1, “Part Numbers Fully

Table 65. Package Thermal Characteristics for TBGA (continued)

Characteristic	Symbol	Value	Unit	Notes
Junction-to-package natural convection on top	Ψ_{JT}	1	°C/W	6

Notes:
1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single-layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal, 1 m/s is approximately equal to 200 linear feet per minute (LFM).
4. Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

Table 66 provides the package thermal characteristics for the 620 29 × 29 mm PBGA of the MPC8347EA.

Table 66. Package Thermal Characteristics for PBGA

Parameter	Symbol	Value	Unit	Notes
Junction-to-ambient natural convection on single-layer board (1s)	$R_{\theta JA}$	21	°C/W	1, 2
Junction-to-ambient natural convection on four-layer board (2s2p)	$R_{\theta JMA}$	15	°C/W	1, 3
Junction-to-ambient (at 200 ft/min) on single-layer board (1s)	$R_{\theta JMA}$	17	°C/W	1, 3
Junction-to-ambient (at 200 ft/min) on four-layer board (2s2p)	$R_{\theta JMA}$	12	°C/W	1, 3
Junction-to-board thermal	$R_{\theta JB}$	6	°C/W	4
Junction-to-case thermal	$R_{\theta JC}$	5	°C/W	5
Junction-to-package natural convection on top	Ψ_{JT}	5	°C/W	6

Notes
1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single-layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal.
4. Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

20.2 Thermal Management Information

For the following sections, $P_D = (V_{DD} \times I_{DD}) + P_{I/O}$ where $P_{I/O}$ is the power dissipation of the I/O drivers. See Table 5 for I/O power dissipation values.

parts including extended temperatures, refer to the device product summary page on our website listed on the back cover of this document or, contact your local Freescale sales office.

Table 70. Part Numbering Nomenclature

MPC	nnnn	e	t	pp	aa	a	r
Product Code	**Part Identifier**	**Encryption Acceleration**	**Temperature[1] Range**	**Package[2]**	**Processor Frequency[3]**	**Platform Frequency**	**Revision Level**
MPC	8347	Blank = Not included E = included	Blank = 0 to 105°C C = –40 to 105°C	ZU =TBGA VV = PB free TBGA ZQ = PBGA VR = PB Free PBGA	e300 core speed AD = 266 AG = 400 AJ = 533 AL = 667	D = 266 F = 333[4]	B = 3.1

Notes:
1. For temperature range = C, processor frequency is limited to 400 (PBGA) with a platform frequency of 266 and up to 533 (TBGA) with a platform frequency of 333
2. See Section 18, “Package and Pin Listings,” for more information on available package types.
3. Processor core frequencies supported by parts addressed by this specification only. Not all parts described in this specification support all core frequencies. Additionally, parts addressed by Part Number Specifications may support other maximum core frequencies.
4. ALF marked parts support DDR1 data rate up to 333 MHz (at 333 MHz CSB as the 'F' marking implies) and DDR2 data rate up to 400 MHz (at 200 MHz CSB). AJF marked parts support DDR1 and DDR2 data rate up to 333 MHz (at a CSB of 333 MHz).

Table 71 shows the SVR settings by device and package type.
