Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

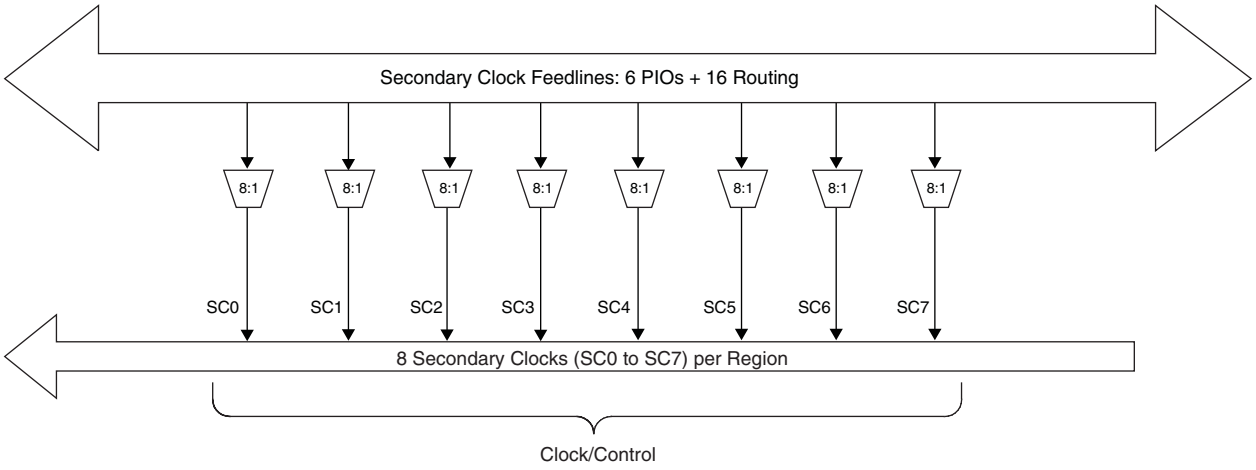
Figure 2-16. Per Region Secondary Clock Selection



Slice Clock Selection

Figure 2-17 shows the clock selections and Figure 2-18 shows the control selections for Slice0 through Slice2. All the primary clocks and seven secondary clocks are routed to this clock selection mux. Other signals can be used as a clock input to the slices via routing. Slice controls are generated from the secondary clocks/controls or other signals connected via routing.

If none of the signals are selected for both clock and control then the default value of the mux output is 1. Slice 3 does not have any registers; therefore it does not have the clock or control muxes.

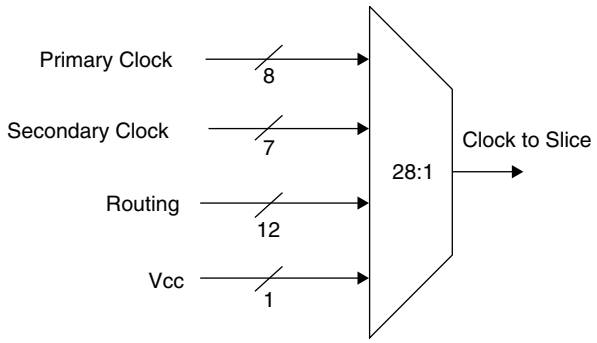

Figure 2-18. Slice0 through Slice2 Control Selection

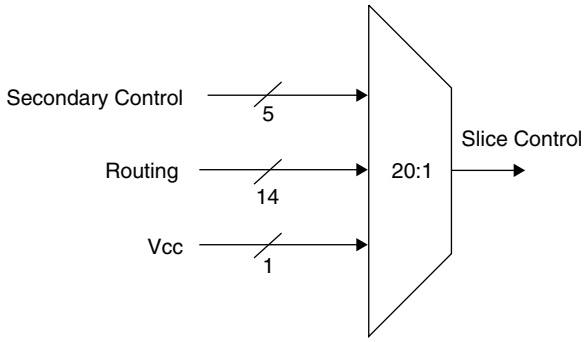

Figure 2-20. Sources of Edge Clock (Left and Right Edges)

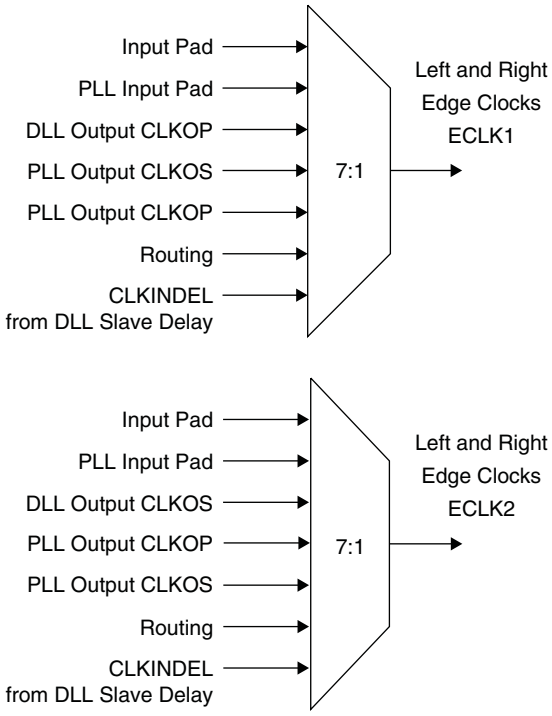

Figure 2-21. Sources of Edge Clock (Top Edge)

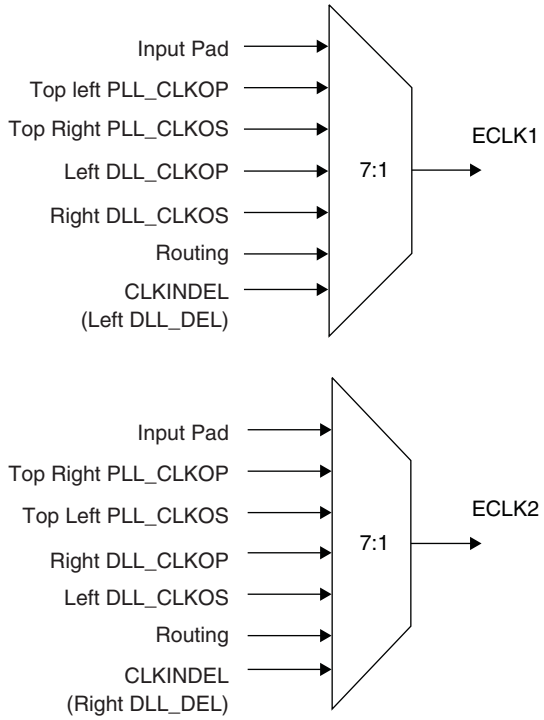
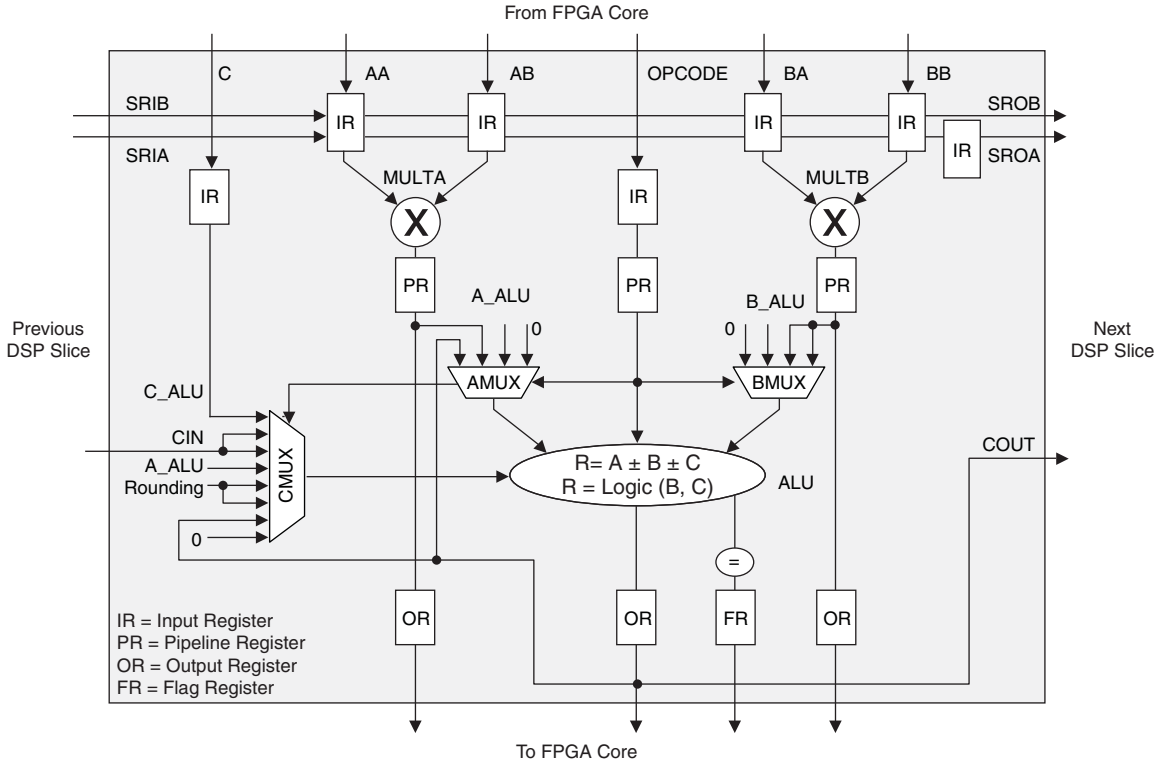


The edge clocks have low injection delay and low skew. They are used to clock the I/O registers and thus are ideal for creating I/O interfaces with a single clock signal and a wide data bus. They are also used for DDR Memory or Generic DDR interfaces.

Figure 2-25. Detailed sysDSP Slice Diagram



Note: A_ALU, B_ALU and C_ALU are internal signals generated by combining bits from AA, AB, BA BB and C inputs. See TN1182, LatticeECP3 sysDSP Usage Guide, for further information.

The LatticeECP2 sysDSP block supports the following basic elements.

- MULT (Multiply)
- MAC (Multiply, Accumulate)
- MULTADDSUB (Multiply, Addition/Subtraction)
- MULTADDSUBSUM (Multiply, Addition/Subtraction, Summation)

Table 2-8 shows the capabilities of each of the LatticeECP3 slices versus the above functions.

Table 2-8. Maximum Number of Elements in a Slice

Width of Multiply	x9	x18	x36
MULT	4	2	1/2
MAC	1	1	—
MULTADDSUB	2	1	—
MULTADDSUBSUM	1[1]	1/2	—

1. One slice can implement 1/2 9x9 m9x9addsubsum and two m9x9addsubsum with two slices.

Some options are available in the four elements. The input register in all the elements can be directly loaded or can be loaded as a shift register from previous operand registers. By selecting “dynamic operation” the following operations are possible:

- In the Add/Sub option the Accumulator can be switched between addition and subtraction on every cycle.
- The loading of operands can switch between parallel and serial operations.

MULTADDSUB DSP Element

In this case, the operands AA and AB are multiplied and the result is added/subtracted with the result of the multiplier operation of operands BA and BB. The user can enable the input, output and pipeline registers. Figure 2-29 shows the MULTADDSUB sysDSP element.

Figure 2-29. MULTADDSUB

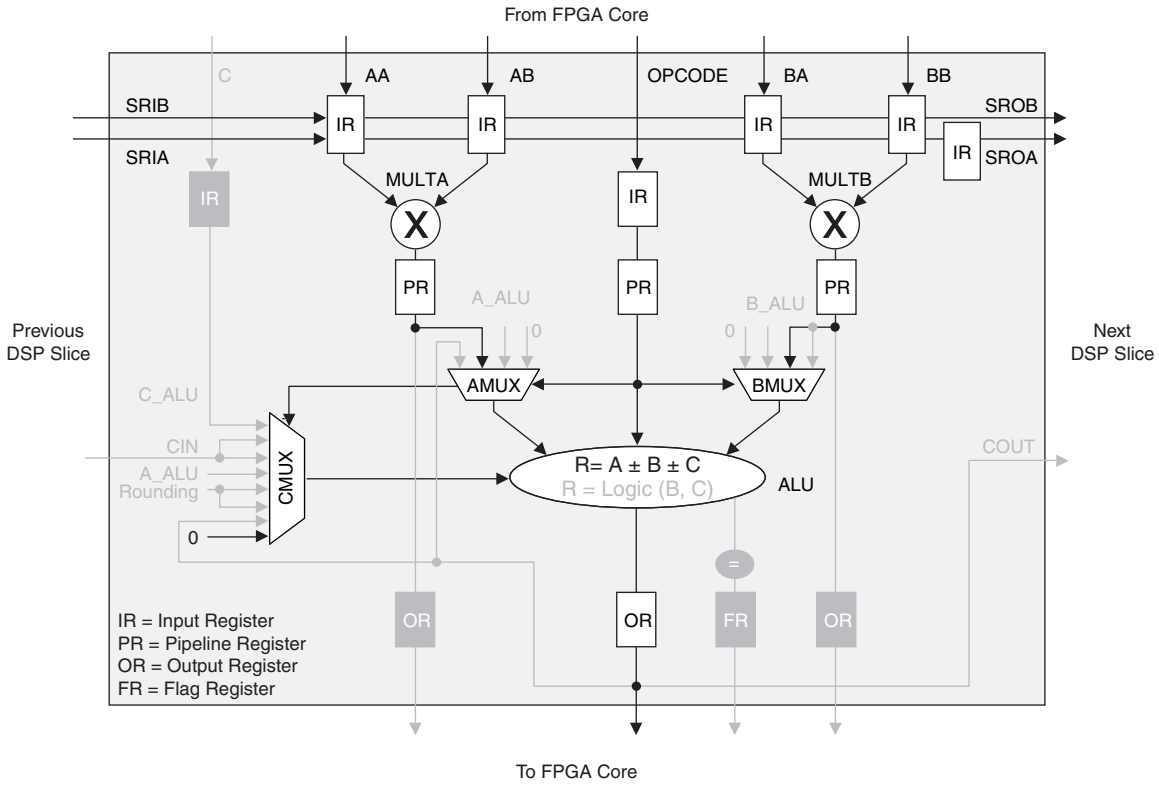


Figure 2-34. Output and Tristate Block for Left and Right Edges

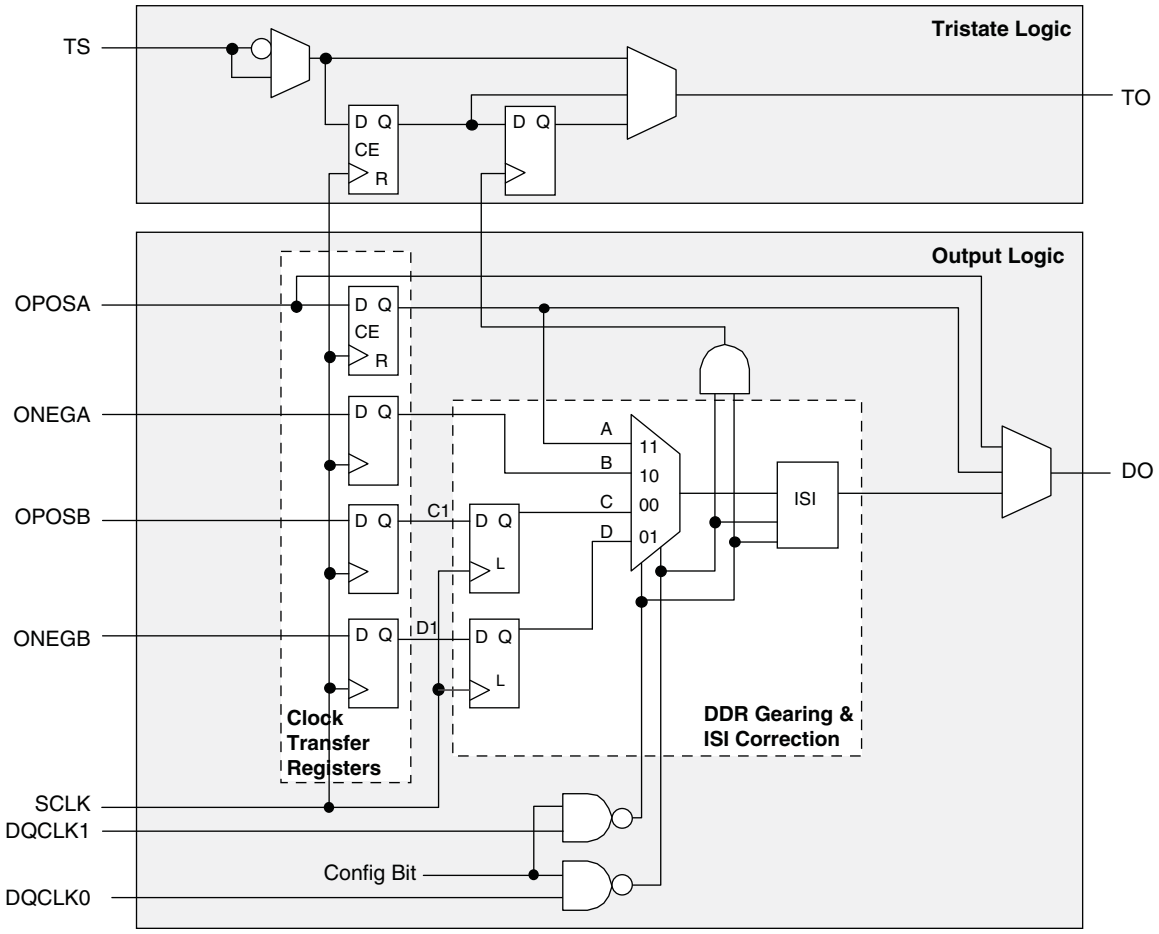


Tristate Register Block

The tristate register block registers tri-state control signals from the core of the device before they are passed to the sysI/O buffers. The block contains a register for SDR operation and an additional register for DDR operation.

In SDR and non-gearing DDR modes, TS input feeds one of the flip-flops that then feeds the output. In DDRX2 mode, the register TS input is fed into another register that is clocked using the DQCLK0 and DQCLK1 signals. The output of this register is used as a tristate control.

ISI Calibration

The setting for Inter-Symbol Interference (ISI) cancellation occurs in the output register block. ISI correction is only available in the DDRX2 modes. ISI calibration settings exist once per output register block, so each I/O in a DQS-12 group may have a different ISI calibration setting.

The ISI block extends output signals at certain times, as a function of recent signal history. So, if the output pattern consists of a long strings of 0's to long strings of 1's, there are no delays on output signals. However, if there are quick, successive transitions from 010, the block will stretch out the binary 1. This is because the long trail of 0's will cause these symbols to interfere with the logic 1. Likewise, if there are quick, successive transitions from 101, the block will stretch out the binary 0. This block is controlled by a 3-bit delay control that can be set in the DQS control logic block.

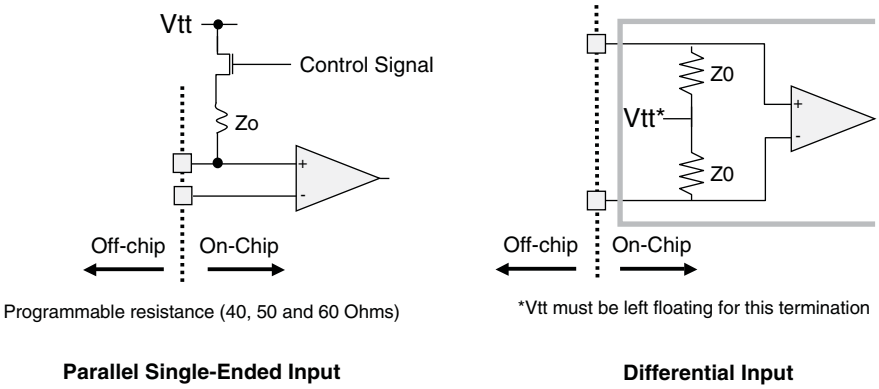
For more information about this topic, please see the list of technical documentation at the end of this data sheet.

On-Chip Programmable Termination

The LatticeECP3 supports a variety of programmable on-chip terminations options, including:

- Dynamically switchable Single-Ended Termination with programmable resistor values of 40, 50, or 60 Ohms. External termination to Vtt should be used for DDR2 and DDR3 memory controller implementation.
- Common mode termination of 80, 100, 120 Ohms for differential inputs

Figure 2-39. On-Chip Termination



See Table 2-12 for termination options for input modes.

1. TERMINATE to VTT and DIFFRENTIAL TERMINATION RESISTOR when turned on can only have one setting per bank. Only left and right banks have this feature.
   Use of TERMINATE to VTT and DIFFRENTIAL TERMINATION RESISTOR are mutually exclusive in an I/O bank.
   On-chip termination tolerance +/– 20%
2. External termination to VTT should be used when implementing DDR2 and DDR3 memory controller.

LVPECL33

The LatticeECP3 devices support the differential LVPECL standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

Derating Timing Tables

Logic timing provided in the following sections of this data sheet and the Diamond and ispLEVER design tools are worst case numbers in the operating range. Actual delays at nominal temperature and voltage for best case process, can be much better than the values given in the tables. The Diamond and ispLEVER design tools can provide logic timing numbers at a particular temperature and voltage.

1. Internal parameters are characterized but not tested on every device.
2. Commercial timing numbers are shown. Industrial timing numbers are typically slower and can be extracted from the Diamond or ispLEVER software.
3. DSP slice is configured in Multiply Add/Sub 18 x 18 mode.
4. The output register is in Flip-flop mode.
5. For details on –9 speed grade devices, please contact your Lattice Sales Representative.

LatticeECP3 Maximum I/O Buffer Speed (Continued)[1, 2, 3, 4, 5, 6]

Over Recommended Operating Conditions

Buffer	Description	Max.	Units
PCI33	PCI, V_{CCIO} = 3.3 V	66	MHz

1. These maximum speeds are characterized but not tested on every device.
2. Maximum I/O speed for differential output standards emulated with resistors depends on the layout.
3. LVCMOS timing is measured with the load specified in the Switching Test Conditions table of this document.
4. All speeds are measured at fast slew.
5. Actual system operation may vary depending on user logic implementation.
6. Maximum data rate equals 2 times the clock rate when utilizing DDR.

Date	Version	Section	Change Summary
			LatticeECP3 Maximum I/O Buffer Speed table – Description column, references to VCCIO = 3.0V changed to 3.3V.
			Updated SERDES External Reference Clock Waveforms.
			Transmitter and Receiver Latency Block Diagram – Updated sections of the diagram to match descriptions on the SERDES/PCS Latency Break-down table.
		Pinout Information	"Logic Signal Connections" section heading renamed "Package Pinout Information". Software menu selections within this section have been updated.
			Signal Descriptions table – Updated description for V_{CCA} signal.
April 2012	02.2EA	Architecture	Updated first paragraph of Output Register Block section.
			Updated the information about sysIO buffer pairs below Figure 2-38.
			Updated the information relating to migration between devices in the Density Shifting section.
		DC and Switching Characteristics	Corrected the Definitions in the sysCLOCK PLL Timing table for t_{RST}.
		Ordering Information	Updated topside marks with new logos in the Ordering Information section.
February 2012	02.1EA	All	Updated document with new corporate logo.
November 2011	02.0EA	Introduction	Added information for LatticeECP3-17EA, 328-ball csBGA package.
		Architecture	Added information for LatticeECP3-17EA, 328-ball csBGA package.
		DC and Switching Characteristics	Updated LatticeECP3 Supply Current table power numbers.
			Typical Building Block Function Performance table, LatticeECP3 External Switching Characteristics table, LatticeECP3 Internal Switching Characteristics table and LatticeECP3 Family Timing Adders: Added speed grade -9 and updated speed grade -8, -7 and -6 timing numbers.
		Pinout Information	Added information for LatticeECP3-17EA, 328-ball csBGA package.
		Ordering Information	Added information for LatticeECP3-17EA, 328-ball csBGA package.
			Added ordering information for low power devices and -9 speed grade devices.
July 2011	01.9EA	DC and Switching Characteristics	Removed ESD Performance table and added reference to LatticeECP3 Product Family Qualification Summary document.
			sysCLOCK PLL TIming table, added footnote 4.
			External Reference Clock Specification table – removed reference to VREF-CM-AC and removed footnote for VREF-CM-AC.
		Pinout Information	Pin Information Summary table: Corrected VCCIO Bank8 data for LatticeECP3-17EA 256-ball ftBGA package and LatticeECP-35EA 256-ball ftBGA package.
April 2011	01.8EA	Architecture	Updated Secondary Clock/Control Sources text section.
		DC and Switching Characteristics	Added data for 150 Mbps to SERDES Power Supply Requirements table.
			Updated Frequencies in Table 3-6 Serial Output Timing and Levels
			Added Data for 150 Mbps to Table 3-7 Channel Output Jitter
			Corrected External Switching Characteristics table, Description for DDR3 Clock Timing, t_{JIT}.
			Corrected Internal Switching Characteristics table, Description for EBR Timing, t_{SUWREN_EBR} and t_{HWREN_EBR}.
			Added footnote 1 to sysConfig Port Timing Specifications table.
			Updated description for RX-CIDs to 150M in Table 3-9 Serial Input Data Specifications
