
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Not For New Designs
Number of LABs/CLBs	11500
Number of Logic Elements/Cells	92000
Total RAM Bits	4526080
Number of I/O	490
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1156-BBGA
Supplier Device Package	1156-FPBGA (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe3-95ea-9fn1156c

LatticeECP3 Family Data Sheet Introduction

February 2012 | Data Sheet DS1021

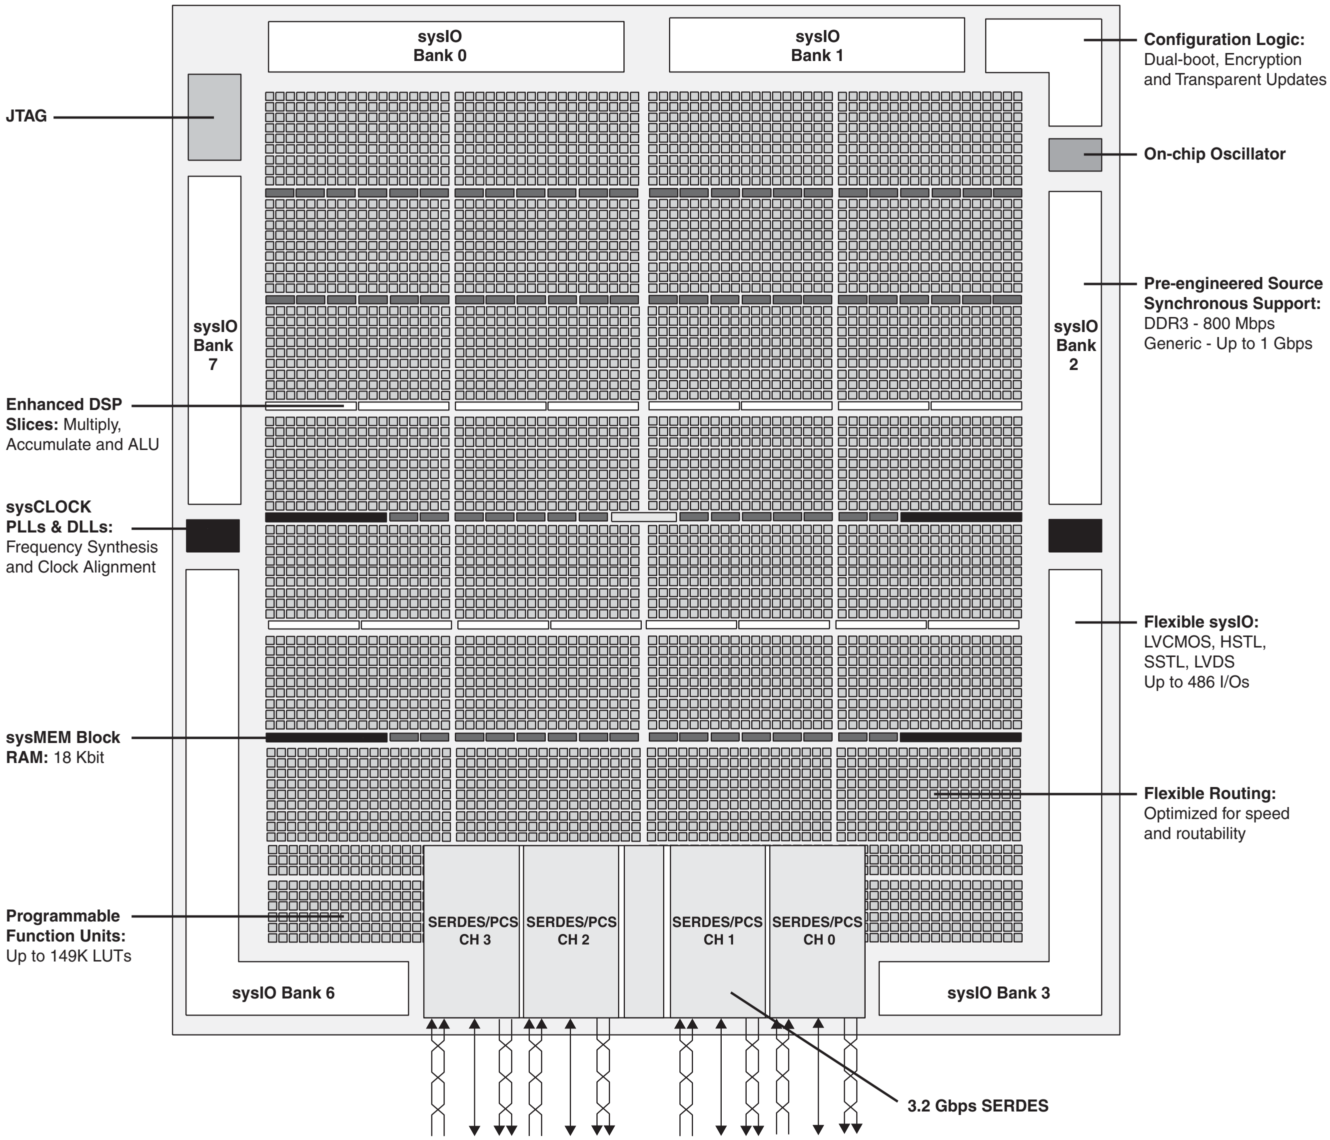
Features

- **Higher Logic Density for Increased System Integration**
  - 17K to 149K LUTs
  - 116 to 586 I/Os
- **Embedded SERDES**
  - 150 Mbps to 3.2 Gbps for Generic 8b10b, 10-bit SERDES, and 8-bit SERDES modes
  - Data Rates 230 Mbps to 3.2 Gbps per channel for all other protocols
  - Up to 16 channels per device: PCI Express, SONET/SDH, Ethernet (1GbE, SGMII, XAUI), CPRI, SMPTE 3G and Serial RapidIO
- **sysDSP™**
  - Fully cascadable slice architecture
  - 12 to 160 slices for high performance multiply and accumulate
  - Powerful 54-bit ALU operations
  - Time Division Multiplexing MAC Sharing
  - Rounding and truncation
  - Each slice supports
    - Half 36x36, two 18x18 or four 9x9 multipliers
    - Advanced 18x36 MAC and 18x18 Multiply-Multiply-Accumulate (MMAC) operations
- **Flexible Memory Resources**
  - Up to 6.85Mbits sysMEM™ Embedded Block RAM (EBR)
  - 36K to 303K bits distributed RAM
- **sysCLOCK Analog PLLs and DLLs**
  - Two DLLs and up to ten PLLs per device
- **Pre-Engineered Source Synchronous I/O**
  - DDR registers in I/O cells
  - Dedicated read/write levelling functionality
  - Dedicated gearing logic
  - Source synchronous standards support
    - ADC/DAC, 7:1 LVDS, XGMII
    - High Speed ADC/DAC devices
  - Dedicated DDR/DDR2/DDR3 memory with DQS support
  - Optional Inter-Symbol Interference (ISI) correction on outputs
- **Programmable sysI/O™ Buffer Supports Wide Range of Interfaces**
  - On-chip termination
  - Optional equalization filter on inputs
  - LVTTL and LVCMOS 33/25/18/15/12
  - SSTL 33/25/18/15 I, II
  - HSTL15 I and HSTL18 I, II
  - PCI and Differential HSTL, SSTL
  - LVDS, Bus-LVDS, LVPECL, RSDS, MLVDS
- **Flexible Device Configuration**
  - Dedicated bank for configuration I/Os
  - SPI boot flash interface
  - Dual-boot images supported
  - Slave SPI
  - TransFR™ I/O for simple field updates
  - Soft Error Detect embedded macro
- **System Level Support**
  - IEEE 1149.1 and IEEE 1532 compliant
  - Reveal Logic Analyzer
  - ORCAstra FPGA configuration utility
  - On-chip oscillator for initialization & general use
  - 1.2 V core power supply

Table 1-1. LatticeECP3™ Family Selection Guide

Device	ECP3-17	ECP3-35	ECP3-70	ECP3-95	ECP3-150
LUTs (K)	17	33	67	92	149
sysMEM Blocks (18 Kbits)	38	72	240	240	372
Embedded Memory (Kbits)	700	1327	4420	4420	6850
Distributed RAM Bits (Kbits)	36	68	145	188	303
18 x 18 Multipliers	24	64	128	128	320
SERDES (Quad)	1	1	3	3	4
PLLs/DLLs	2 / 2	4 / 2	10 / 2	10 / 2	10 / 2
Packages and SERDES Channels/ I/O Combinations					
328 csBGA (10 x 10 mm)	2 / 116				
256 ftBGA (17 x 17 mm)	4 / 133	4 / 133			
484 fpBGA (23 x 23 mm)	4 / 222	4 / 295	4 / 295	4 / 295	
672 fpBGA (27 x 27 mm)		4 / 310	8 / 380	8 / 380	8 / 380
1156 fpBGA (35 x 35 mm)			12 / 490	12 / 490	16 / 586

Figure 2-1. Simplified Block Diagram, LatticeECP3-35 Device (Top Level)



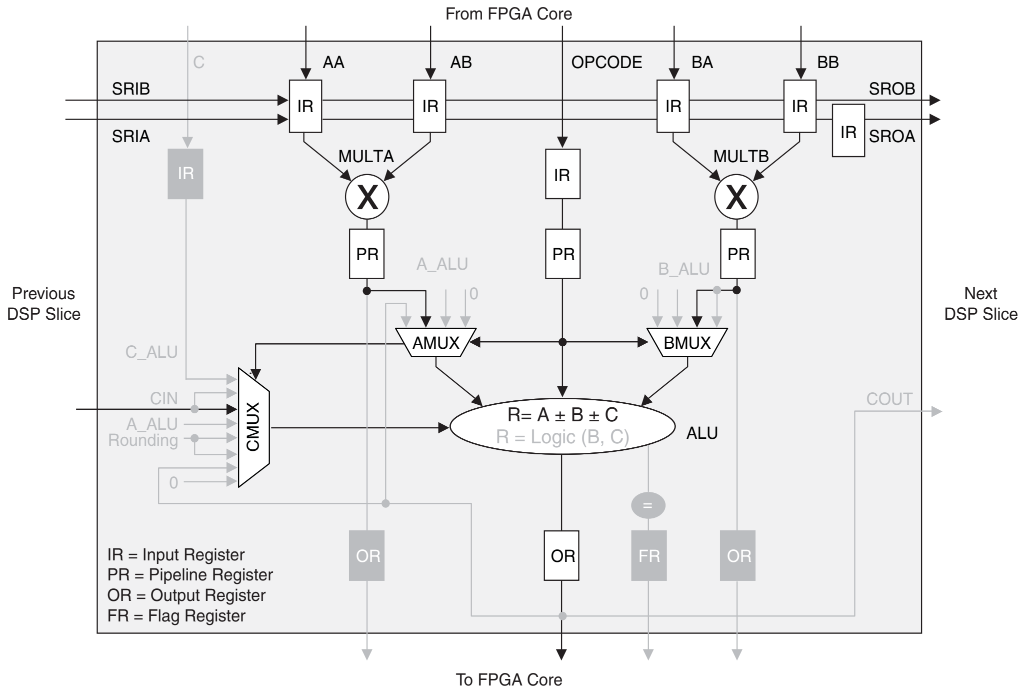
Note: There is no Bank 4 or Bank 5 in LatticeECP3 devices.

PFU Blocks

The core of the LatticeECP3 device consists of PFU blocks, which are provided in two forms, the PFU and PFF. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic and ROM functions. Except where necessary, the remainder of this data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected slices numbered 0-3 as shown in Figure 2-2. Each slice contains two LUTs. All the interconnections to and from PFU blocks are from routing. There are 50 inputs and 23 outputs associated with each PFU block.

Figure 2-31. MULTADDSUBSUM Slice 1



Advanced sysDSP Slice Features

Cascading

The LatticeECP3 sysDSP slice has been enhanced to allow cascading. Adder trees are implemented fully in sysDSP slices, improving the performance. Cascading of slices uses the signals CIN, COUT and C Mux of the slice.

Addition

The LatticeECP3 sysDSP slice allows for the bypassing of multipliers and cascading of adder logic. High performance adder functions are implemented without the use of LUTs. The maximum width adders that can be implemented are 54-bit.

Rounding

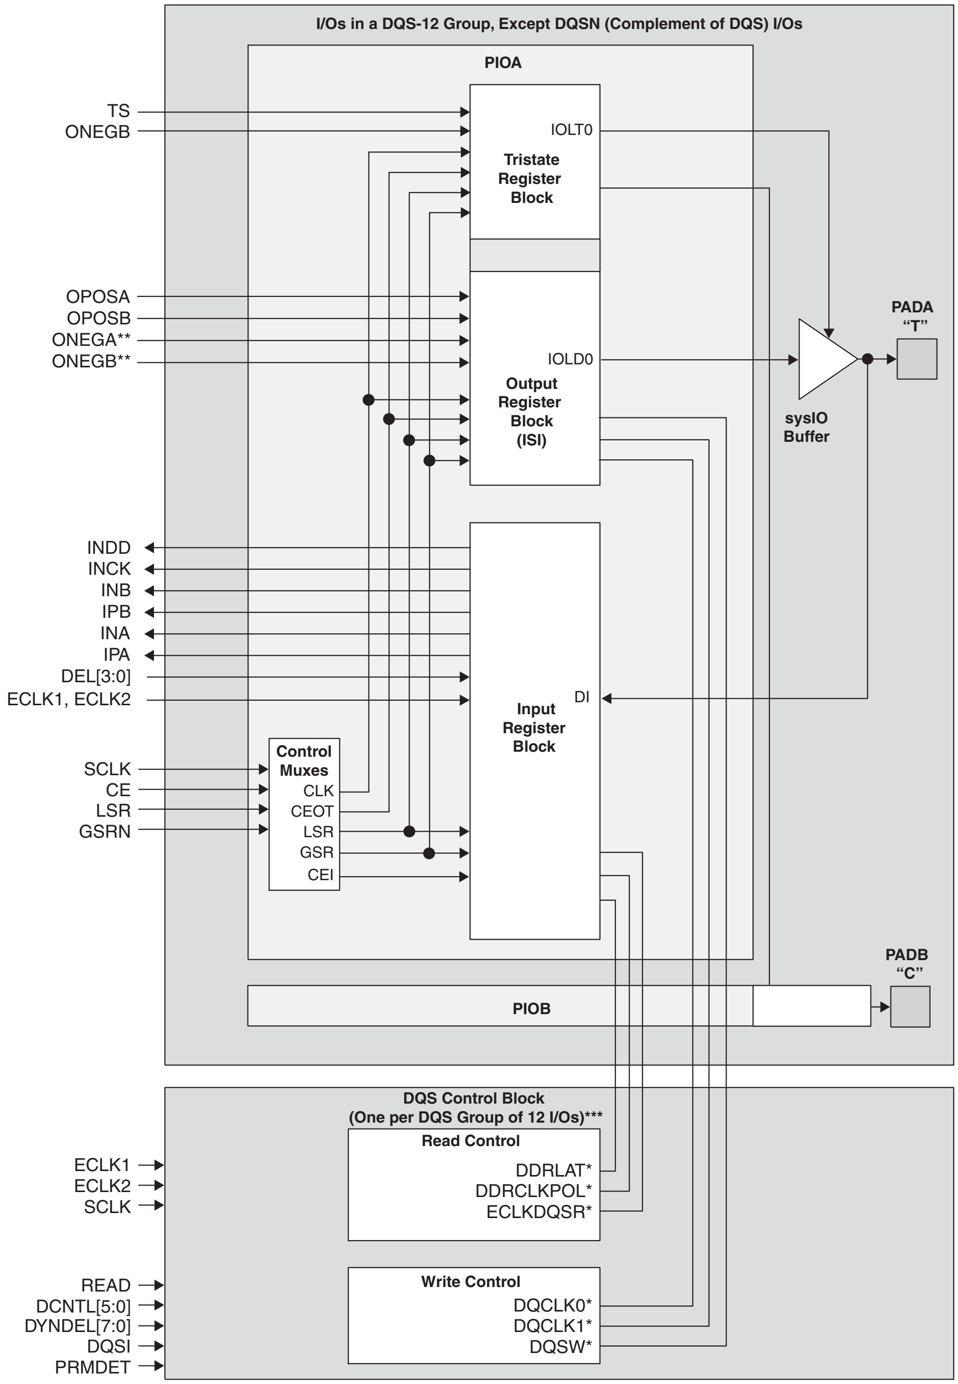
The rounding operation is implemented in the ALU and is done by adding a constant followed by a truncation operation. The rounding methods supported are:

- Rounding to zero (RTZ)
- Rounding to infinity (RTI)
- Dynamic rounding
- Random rounding
- Convergent rounding

Programmable I/O Cells (PIC)

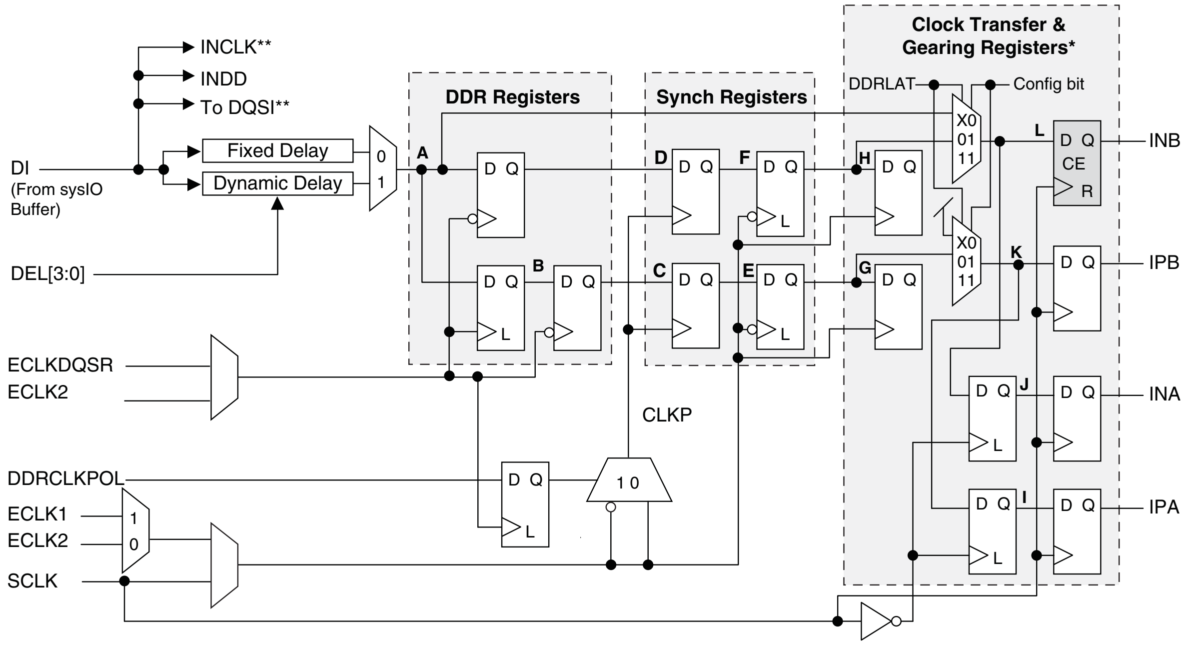
Each PIC contains two PIOs connected to their respective sysI/O buffers as shown in Figure 2-32. The PIO Block supplies the output data (DO) and the tri-state control signal (TO) to the sysI/O buffer and receives input from the buffer. Table 2-11 provides the PIO signal list.

Figure 2-32. PIC Diagram



* Signals are available on left/right/top edges only.
** Signals are available on the left and right sides only
*** Selected PIO.

Figure 2-33. Input Register Block for Left, Right and Top Edges



* Only on the left and right sides.
** Selected PIO.
Note: Simplified diagram does not show CE/SET/REST details.

Output Register Block

The output register block registers signals from the core of the device before they are passed to the sysI/O buffers. The blocks on the left and right PIOs contain registers for SDR and full DDR operation. The topside PIO block is the same as the left and right sides except it does not support ODDRX2 gearing of output logic. ODDRX2 gearing is used in DDR3 memory interfaces.The PIO blocks on the bottom contain the SDR registers but do not support generic DDR.

Figure 2-34 shows the Output Register Block for PIOs on the left and right edges.

In SDR mode, OPOSA feeds one of the flip-flops that then feeds the output. The flip-flop can be configured as a Dtype or latch. In DDR mode, two of the inputs are fed into registers on the positive edge of the clock. At the next clock cycle, one of the registered outputs is also latched.

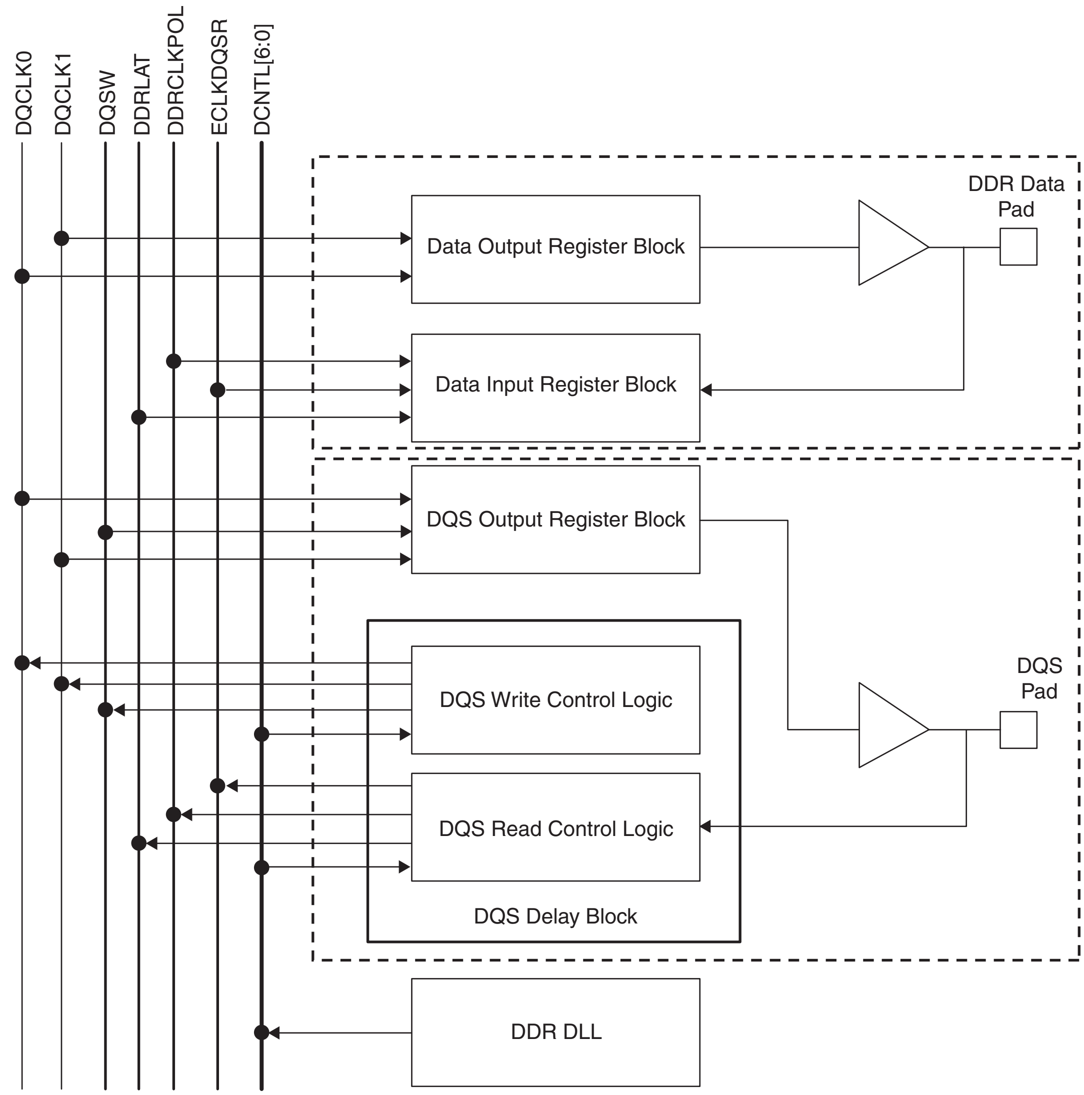
A multiplexer running off the same clock is used to switch the mux between the 11 and 01 inputs that will then feed the output.

A gearbox function can be implemented in the output register block that takes four data streams: OPOSA, ONEGA, OPOSB and ONEGB. All four data inputs are registered on the positive edge of the system clock and two of them are also latched. The data is then output at a high rate using a multiplexer that runs off the DQCLK0 and DQCLK1 clocks. DQCLK0 and DQCLK1 are used in this case to transfer data from the system clock to the edge clock domain. These signals are generated in the DQS Write Control Logic block. See Figure 2-37 for an overview of the DQS write control logic.

Please see TN1180, LatticeECP3 High-Speed I/O Interface for more information on this topic.

Further discussion on using the DQS strobe in this module is discussed in the DDR Memory section of this data sheet.

Figure 2-37. DQS Local Bus



Polarity Control Logic

In a typical DDR Memory interface design, the phase relationship between the incoming delayed DQS strobe and the internal system clock (during the READ cycle) is unknown. The LatticeECP3 family contains dedicated circuits to transfer data between these domains. A clock polarity selector is used to prevent set-up and hold violations at the domain transfer between DQS (delayed) and the system clock. This changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of each READ cycle for the correct clock polarity.

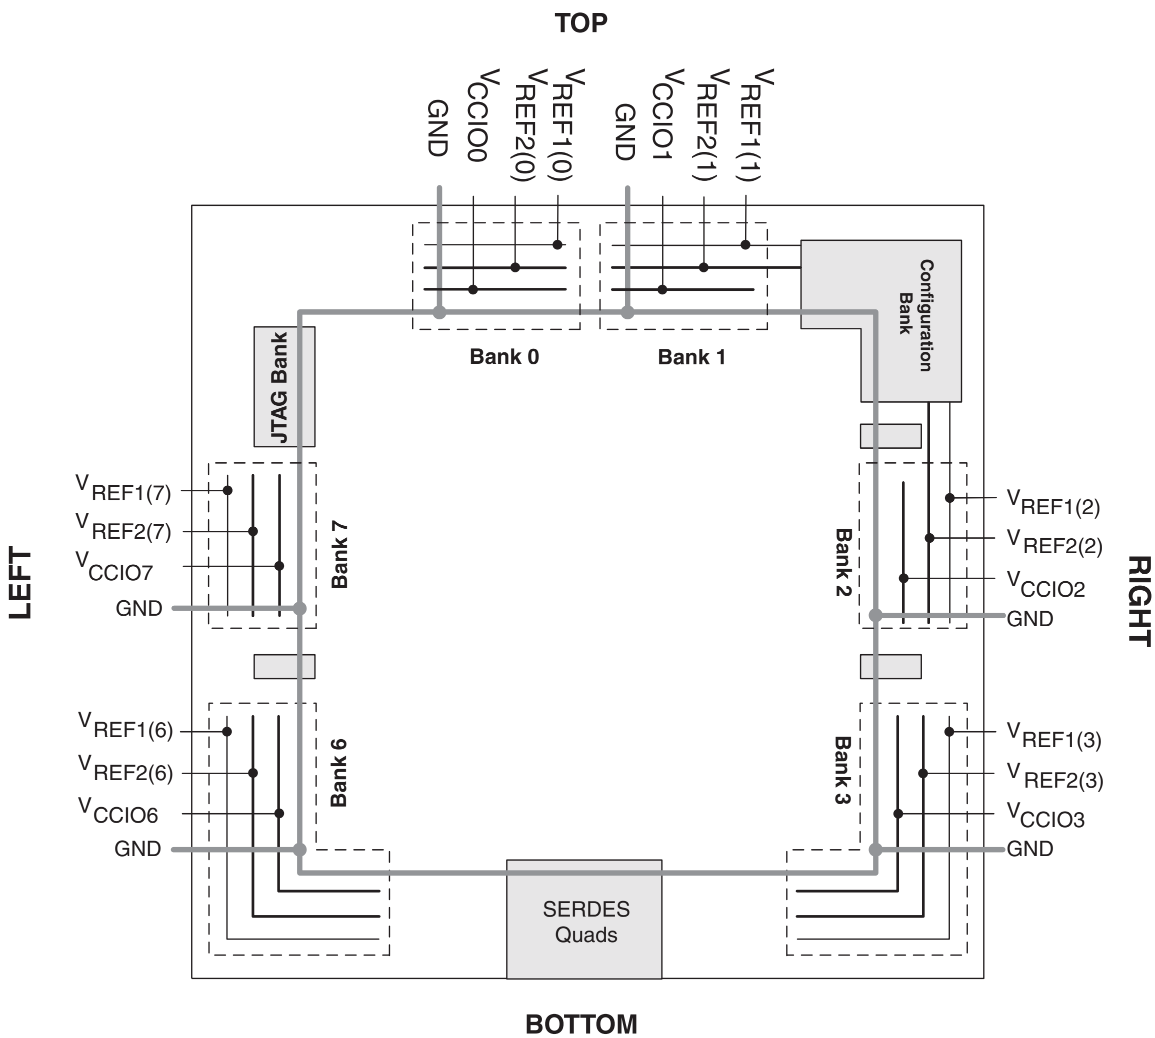
Prior to the READ operation in DDR memories, DQS is in tristate (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit detects the first DQS rising edge after the preamble state. This signal is used to control the polarity of the clock to the synchronizing registers.

DDR3 Memory Support

LatticeECP3 supports the read and write leveling required for DDR3 memory interfaces.

Read leveling is supported by the use of the DDRCLKPOL and the DDRLAT signals generated in the DQS Read Control logic block. These signals dynamically control the capture of the data with respect to the DQS at the input register block.

Figure 2-38. LatticeECP3 Banks



LatticeECP3 devices contain two types of sysI/O buffer pairs.

1. **Top (Bank 0 and Bank 1) and Bottom sysIO Buffer Pairs (Single-Ended Outputs Only)**
   The sysI/O buffer pairs in the top banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (both ratioed and referenced). One of the referenced input buffers can also be configured as a differential input. Only the top edge buffers have a programmable PCI clamp.

   The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

   The top and bottom sides are ideal for general purpose I/O, PCI, and inputs for LVDS (LVDS outputs are only allowed on the left and right sides). The top side can be used for the DDR3 ADDR/CMD signals.

   The I/O pins located on the top and bottom sides of the device (labeled PTxxA/B or PBxxA/B) are fully hot socketable. Note that the pads in Banks 3, 6 and 8 are wrapped around the corner of the device. In these banks, only the pads located on the top or bottom of the device are hot socketable. The top and bottom side pads can be identified by the Lattice Diamond tool.

2. **Left and Right (Banks 2, 3, 6 and 7) sysI/O Buffer Pairs (50% Differential and 100% Single-Ended Outputs)**
The sysI/O buffer pairs in the left and right banks of the device consist of two single-ended output drivers, two sets of single-ended input buffers (both ratioed and referenced) and one differential output driver. One of the referenced input buffers can also be configured as a differential input. In these banks the two pads in the pair are described as "true" and "comp", where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

In addition, programmable on-chip input termination (parallel or differential, static or dynamic) is supported on these sides, which is required for DDR3 interface. However, there is no support for hot-socketing for the I/O pins located on the left and right side of the device as the PCI clamp is always enabled on these pins.

LVDS, RSDS, PPLVDS and Mini-LVDS differential output drivers are available on 50% of the buffer pairs on the left and right banks.

3. **Configuration Bank sysI/O Buffer Pairs (Single-Ended Outputs, Only on Shared Pins When Not Used by Configuration)**
The sysI/O buffers in the Configuration Bank consist of ratioed single-ended output drivers and single-ended input buffers. This bank does not support PCI clamp like the other banks on the top, left, and right sides.

The two pads in the pair are described as "true" and "comp", where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

Programmable PCI clamps are only available on the top banks. PCI clamps are used primarily on inputs and bi-directional pads to reduce ringing on the receiving end.

Typical sysI/O I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC}, V_{CCIO8} and V_{CCAUX} have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all other V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. For more information about controlling the output logic state with valid input logic levels during power-up in LatticeECP3 devices, see the list of technical documentation at the end of this data sheet.

The V_{CC} and V_{CCAUX} supply the power to the FPGA core fabric, whereas the V_{CCIO} supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, it is recommended that the I/O buffers be powered-up prior to the FPGA core fabric. V_{CCIO} supplies should be powered-up before or together with the V_{CC} and V_{CCAUX} supplies.

Supported sysI/O Standards

The LatticeECP3 sysI/O buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS, LVTTL and other standards. The buffers support the LVTTL, LVCMOS 1.2 V, 1.5 V, 1.8 V, 2.5 V and 3.3 V standards. In the LVCMOS and LVTTL modes, the buffer has individual configuration options for drive strength, slew rates, bus maintenance (weak pull-up, weak pull-down, or a bus-keeper latch) and open drain. Other single-ended standards supported include SSTL and HSTL. Differential standards supported include LVDS, BLVDS, LVPECL, MLVDS, RSDS, Mini-LVDS, PPLVDS (point-to-point LVDS), TRLVDS (Transition Reduced LVDS), differential SSTL and differential HSTL. For further information on utilizing the sysI/O buffer to support a variety of standards please see TN1177, LatticeECP3 sysIO Usage Guide.

Hot Socketing Specifications[1, 2, 3]

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
IDK_HS[4]	Input or I/O Leakage Current	$0 \le V_{IN} \le V_{IH}$ (Max.)	—	—	+/–1	mA
IDK[5]	Input or I/O Leakage Current	$0 \le V_{IN} < V_{CCIO}$	—	—	+/–1	mA
		$V_{CCIO} \le V_{IN} \le V_{CCIO} + 0.5V$	—	18	—	mA

1. V_{CC}, V_{CCAUX} and V_{CCIO} should rise/fall monotonically.
2. I_{DK} is additive to I_{PU}, I_{PD} or I_{BH}.
3. LVCMOS and LVTTL only.
4. Applicable to general purpose I/O pins located on the top and bottom sides of the device.
5. Applicable to general purpose I/O pins located on the left and right sides of the device.

Hot Socketing Requirements[1, 2]

Description	Min.	Typ.	Max.	Units
Input current per SERDES I/O pin when device is powered down and inputs driven.	—	—	8	mA

1. Assumes the device is powered down, all supplies grounded, both P and N inputs driven by CML driver with maximum allowed VCCOB (1.575 V), 8b10b data, internal AC coupling.
2. Each P and N input must have less than the specified maximum input current. For a 16-channel device, the total input current would be 8 mA*16 channels *2 input pins per channel = 256 mA

ESD Performance

Please refer to the LatticeECP3 Product Family Qualification Summary for complete qualification data, including ESD performance.

sysI/O Differential Electrical Characteristics

LVDS25

Over Recommended Operating Conditions

Parameter	Description	Test Conditions	Min.	Typ.	Max.	Units
V_{INP}[1], V_{INM}[1]	Input Voltage		0	—	2.4	V
V_{CM}[1]	Input Common Mode Voltage	Half the Sum of the Two Inputs	0.05	—	2.35	V
V_{THD}	Differential Input Threshold	Difference Between the Two Inputs	+/–100	—	—	mV
I_{IN}	Input Current	Power On or Power Off	—	—	+/–10	µA
V_{OH}	Output High Voltage for V_{OP} or V_{OM}	R_T = 100 Ohm	—	1.38	1.60	V
V_{OL}	Output Low Voltage for V_{OP} or V_{OM}	R_T = 100 Ohm	0.9 V	1.03	—	V
V_{OD}	Output Voltage Differential	(V_{OP} - V_{OM}), R_T = 100 Ohm	250	350	450	mV
ΔV_{OD}	Change in V_{OD} Between High and Low		—	—	50	mV
V_{OS}	Output Voltage Offset	(V_{OP} + V_{OM})/2, R_T = 100 Ohm	1.125	1.20	1.375	V
ΔV_{OS}	Change in V_{OS} Between H and L		—	—	50	mV
I_{SAB}	Output Short Circuit Current	V_{OD} = 0V Driver Outputs Shorted to Each Other	—	—	12	mA

1, On the left and right sides of the device, this specification is valid only for V_{CCIO} = 2.5 V or 3.3 V.

Differential HSTL and SSTL

Differential HSTL and SSTL outputs are implemented as a pair of complementary single-ended outputs. All allowable single-ended output classes (class I and class II) are supported in this mode.

LVPECL33

The LatticeECP3 devices support the differential LVPECL standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL33

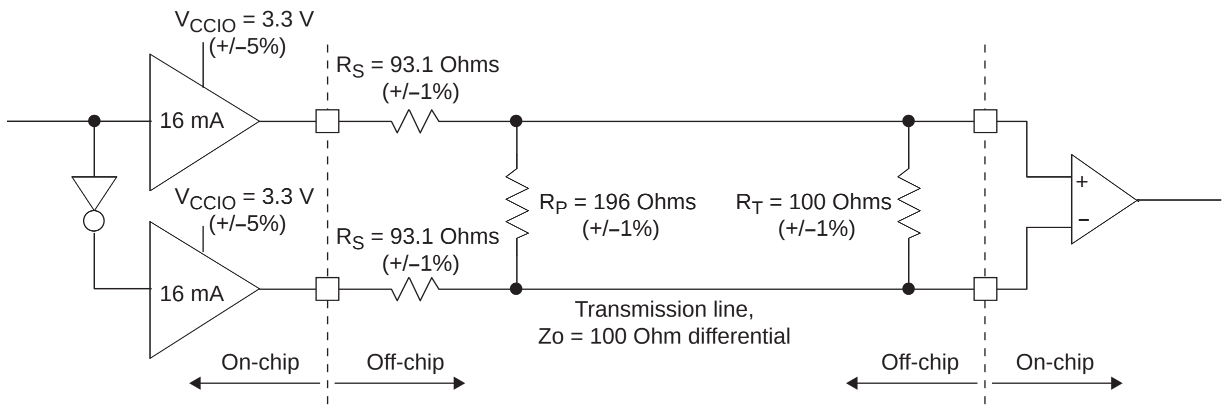


Table 3-3. LVPECL33 DC Conditions[1]

Over Recommended Operating Conditions

Parameter	Description	Typical	Units
V_{CCIO}	Output Driver Supply (+/–5%)	3.30	V
Z_{OUT}	Driver Impedance	10	Ω
R_S	Driver Series Resistor (+/–1%)	93	Ω
R_P	Driver Parallel Resistor (+/–1%)	196	Ω
R_T	Receiver Termination (+/–1%)	100	Ω
V_{OH}	Output High Voltage	2.05	V
V_{OL}	Output Low Voltage	1.25	V
V_{OD}	Output Differential Voltage	0.80	V
V_{CM}	Output Common Mode Voltage	1.65	V
Z_{BACK}	Back Impedance	100.5	Ω
I_{DC}	DC Output Current	12.11	mA

1. For input buffer, see LVDS table.

XAUI/Serial Rapid I/O Type 3/CPRI LV E.30 Electrical and Timing Characteristics

AC and DC Characteristics

Table 3-13. Transmit

Over Recommended Operating Conditions

Symbol	Description	Test Conditions	Min.	Typ.	Max.	Units
T_{RF}	Differential rise/fall time	20%-80%	—	80	—	ps
$Z_{TX\_DIFF\_DC}$	Differential impedance		80	100	120	Ohms
J_{TX_DDJ}[2, 3, 4]	Output data deterministic jitter		—	—	0.17	UI
J_{TX_TJ}[1, 2, 3, 4]	Total output data jitter		—	—	0.35	UI

1. Total jitter includes both deterministic jitter and random jitter.
2. Jitter values are measured with each CML output AC coupled into a 50-Ohm impedance (100-Ohm differential impedance).
3. Jitter and skew are specified between differential crossings of the 50% threshold of the reference signal.
4. Values are measured at 2.5 Gbps.

Table 3-14. Receive and Jitter Tolerance

Over Recommended Operating Conditions

Symbol	Description	Test Conditions	Min.	Typ.	Max.	Units
RL_{RX_DIFF}	Differential return loss	From 100 MHz to 3.125 GHz	10	—	—	dB
RL_{RX_CM}	Common mode return loss	From 100 MHz to 3.125 GHz	6	—	—	dB
Z_{RX_DIFF}	Differential termination resistance		80	100	120	Ohms
J_{RX_DJ}[1, 2, 3]	Deterministic jitter tolerance (peak-to-peak)		—	—	0.37	UI
J_{RX_RJ}[1, 2, 3]	Random jitter tolerance (peak-to-peak)		—	—	0.18	UI
J_{RX_SJ}[1, 2, 3]	Sinusoidal jitter tolerance (peak-to-peak)		—	—	0.10	UI
J_{RX_TJ}[1, 2, 3]	Total jitter tolerance (peak-to-peak)		—	—	0.65	UI
T_{RX_EYE}	Receiver eye opening		0.35	—	—	UI

1. Total jitter includes deterministic jitter, random jitter and sinusoidal jitter. The sinusoidal jitter tolerance mask is shown in Figure 3-18.
2. Jitter values are measured with each high-speed input AC coupled into a 50-Ohm impedance.
3. Jitter and skew are specified between differential crossings of the 50% threshold of the reference signal.
4. Jitter tolerance parameters are characterized when Full Rx Equalization is enabled.
5. Values are measured at 2.5 Gbps.

Date	Version	Section	Change Summary
			LatticeECP3 Maximum I/O Buffer Speed table – Description column, references to VCCIO = 3.0V changed to 3.3V.
			Updated SERDES External Reference Clock Waveforms.
			Transmitter and Receiver Latency Block Diagram – Updated sections of the diagram to match descriptions on the SERDES/PCS Latency Breakdown table.
		Pinout Information	"Logic Signal Connections" section heading renamed "Package Pinout Information". Software menu selections within this section have been updated.
			Signal Descriptions table – Updated description for V_{CCA} signal.
April 2012	02.2EA	Architecture	Updated first paragraph of Output Register Block section.
			Updated the information about sysIO buffer pairs below Figure 2-38.
			Updated the information relating to migration between devices in the Density Shifting section.
		DC and Switching Characteristics	Corrected the Definitions in the sysCLOCK PLL Timing table for t_{RST}.
		Ordering Information	Updated topside marks with new logos in the Ordering Information section.
February 2012	02.1EA	All	Updated document with new corporate logo.
November 2011	02.0EA	Introduction	Added information for LatticeECP3-17EA, 328-ball csBGA package.
		Architecture	Added information for LatticeECP3-17EA, 328-ball csBGA package.
		DC and Switching Characteristics	Updated LatticeECP3 Supply Current table power numbers.
			Typical Building Block Function Performance table, LatticeECP3 External Switching Characteristics table, LatticeECP3 Internal Switching Characteristics table and LatticeECP3 Family Timing Adders: Added speed grade -9 and updated speed grade -8, -7 and -6 timing numbers.
		Pinout Information	Added information for LatticeECP3-17EA, 328-ball csBGA package.
		Ordering Information	Added information for LatticeECP3-17EA, 328-ball csBGA package.
			Added ordering information for low power devices and -9 speed grade devices.
July 2011	01.9EA	DC and Switching Characteristics	Removed ESD Performance table and added reference to LatticeECP3 Product Family Qualification Summary document.
			sysCLOCK PLL TIming table, added footnote 4.
			External Reference Clock Specification table – removed reference to VREF-CM-AC and removed footnote for VREF-CM-AC.
		Pinout Information	Pin Information Summary table: Corrected VCCIO Bank8 data for LatticeECP3-17EA 256-ball ftBGA package and LatticeECP-35EA 256-ball ftBGA package.
April 2011	01.8EA	Architecture	Updated Secondary Clock/Control Sources text section.
		DC and Switching Characteristics	Added data for 150 Mbps to SERDES Power Supply Requirements table.
			Updated Frequencies in Table 3-6 Serial Output Timing and Levels
			Added Data for 150 Mbps to Table 3-7 Channel Output Jitter
			Corrected External Switching Characteristics table, Description for DDR3 Clock Timing, t_{JIT}.
			Corrected Internal Switching Characteristics table, Description for EBR Timing, t_{SUWREN_EBR} and t_{HWREN_EBR}.
			Added footnote 1 to sysConfig Port Timing Specifications table.
			Updated description for RX-CIDs to 150M in Table 3-9 Serial Input Data Specifications

Date	Version	Section	Change Summary
September 2009	01.4	Architecture	Corrected link in sysMEM Memory Block section.
			Updated information for On-Chip Programmable Termination and modified corresponding figure.
			Added footnote 2 to On-Chip Programmable Termination Options for Input Modes table.
			Corrected Per Quadrant Primary Clock Selection figure.
		DC and Switching Characteristics	Modified -8 Timing data for 1024x18 True-Dual Port RAM (Read-Before-Write, EBR Output Registers)
			Added ESD Performance table.
			LatticeECP3 External Switching Characteristics table - updated data for $t_{DIBGDDR}$, t_{W_PRI}, t_{W_EDGE} and $t_{SKEW\_EDGE\_DQS}$.
			LatticeECP3 Internal Switching Characteristics table - updated data for t_{COO_PIO} and added footnote #4.
			sysCLOCK PLL Timing table - updated data for f_{OUT}.
			External Reference Clock Specification (refclkp/refclkn) table - updated data for $V_{REF-IN-SE}$ and $V_{REF-IN-DIFF}$
			LatticeECP3 sysCONFIG Port Timing Specifications table - updated data for t_{MWC}.
			Added TRLVDS DC Specification table and diagram.
			Updated Mini LVDS table.
August 2009	01.3	DC and Switching Characteristics	Corrected truncated numbers for V_{CCIB} and V_{CCOB} in Recommended Operating Conditions table.
July 2009	01.2	Multiple	Changed references of “multi-boot” to “dual-boot” throughout the data sheet.
		Architecture	Updated On-Chip Programmable Termination bullets.
			Updated On-Chip Termination Options for Input Modes table.
			Updated On-Chip Termination figure.
		DC and Switching Characteristics	Changed min/max data for FREF_PPM and added footnote 4 in SERDES External Reference Clock Specification table.
			Updated SERDES minimum frequency.
		Pinout Information	Corrected MCLK to be I/O and CCLK to be I in Signal Descriptions table
May 2009	01.1	All	Removed references to Parallel burst mode Flash.
		Introduction	Features - Changed 250 Mbps to 230 Mbps in Embedded SERDES bulleted section and added a footnote to indicate 230 Mbps applies to 8b10b and 10b12b applications.
			Updated data for ECP3-17 in LatticeECP3 Family Selection Guide table.
			Changed embedded memory from 552 to 700 Kbits in LatticeECP3 Family Selection Guide table.
		Architecture	Updated description for CLKFB in General Purpose PLL Diagram.
			Corrected Primary Clock Sources text section.
			Corrected Secondary Clock/Control Sources text section.
			Corrected Secondary Clock Regions table.
			Corrected note below Detailed sysDSP Slice Diagram.
			Corrected Clock, Clock Enable, and Reset Resources text section.
			Corrected ECP3-17 EBR number in Embedded SRAM in the LatticeECP3 Family table.
			Added On-Chip Termination Options for Input Modes table.
			Updated Available SERDES Quads per LatticeECP3 Devices table.
