What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

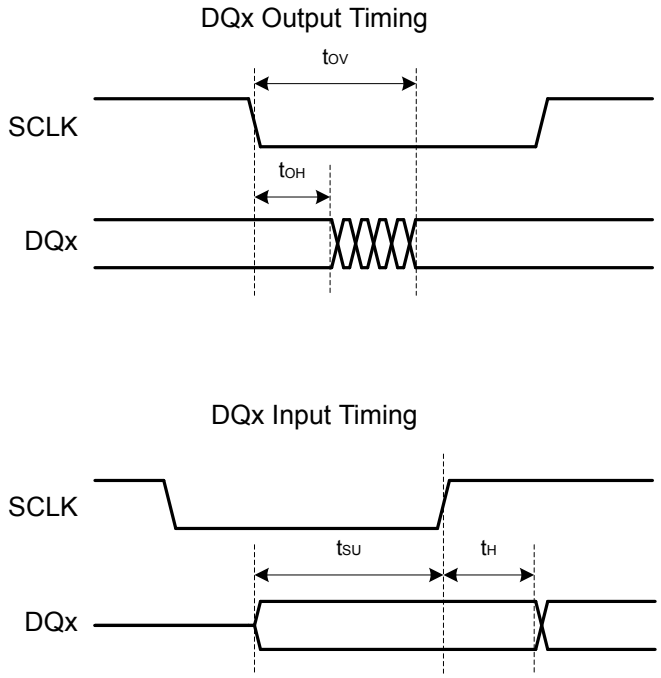

Figure 4.21. QSPI SDR Timing Diagrams

QSPI SDR Flash Timing Example

This example uses timing values for location 0 (SDR mode) to demonstrate the calculation of allowable flash timing using the QSPI in SDR mode.

- Using a configured SCLK frequency (F_{SCLK}) of 19 MHz:
- The resulting minimum period, T(min) = $(1/F_{SCLK})$ * 0.95 = 50.0 ns.
- Flash will see a minimum setup time of T/2 – t_{OV} = T/2 – (T/2 – 2.4) = 2.4 ns.
- Flash will see a minimum hold time of T/2 + t_{OH} = T/2 + (T/2 – 32.9) = T – 32.9 = 50.0 – 32.9 = 17.1 ns.
- Flash can have a maximum output valid time of T/2 – t_{SU} = T/2 – (36.2 – T/2) = T – 36.2 = 50.0 – 36.2 = 13.8 ns.
- Flash can have a minimum output hold time of t_H – T/2 = (T/2 – 3.3) – T/2 = - 3.3 ns.

5.21 Alternate Functionality Overview

A wide selection of alternate functionality is available for multiplexing to various pins. The following table shows the name of the alternate functionality in the first column, followed by columns showing the possible LOCATION bitfield settings and the associated GPIO pin. Refer to 5.20 GPIO Functionality Table for a list of functions available on each GPIO pin.

Note: Some functionality, such as analog interfaces, do not have alternate settings or a LOCATION bitfield. In these cases, the pinout is shown in the column corresponding to LOCATION 0.

Table 6.2. BGA192 PCB Land Pattern Dimensions

Dimension	Min	Nom	Max
X		0.20	
C1		6.00	
C2		6.00	
E1		0.4	
E2		0.4	

Note:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
3. This Land Pattern Design is based on the IPC-7351 guidelines.
4. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 µm minimum, all the way around the pad.
5. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
6. The stencil thickness should be 0.125 mm (5 mils).
7. The ratio of stencil aperture to land pad size should be 1:1.
8. A No-Clean, Type-3 solder paste is recommended.
9. The recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.
