What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	STM8
Core Size	8-Bit
Speed	24MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	68
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	2K x 8
RAM Size	6K x 8
Voltage - Supply (Vcc/Vdd)	2.95V ~ 5.5V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	80-LQFP
Supplier Device Package	80-LQFP (14x14)

4 Product overview

The following section intends to give an overview of the basic features of the STM8S20xxx functional modules and peripherals.

For more detailed information please refer to the corresponding family reference manual (RM0016).

4.1 Central processing unit STM8

The 8-bit STM8 core is designed for code efficiency and performance.

It contains 6 internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing and 80 instructions.

Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus - single cycle fetching for most instructions
- X and Y 16-bit index registers - enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter - 16-Mbyte linear memory space
- 16-bit stack pointer - access to a 64 K-level stack
- 8-bit condition code register - 7 condition flags for the result of the last instruction

Addressing

- 20 addressing modes
- Indexed indirect addressing mode for look-up tables located anywhere in the address space
- Stack pointer relative addressing mode for local variables and parameter passing

Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

Asynchronous communication (UART mode)

- Full duplex communication - NRZ standard format (mark/space)
- Programmable transmit and receive baud rates up to 1 Mbit/s (f_{CPU}/16) and capable of following any standard baud rate regardless of the input frequency
- Separate enable bits for transmitter and receiver
- Two receiver wakeup modes:
  - Address bit (MSB)
  - Idle line (interrupt)
- Transmission error detection with interrupt generation
- Parity control

LIN master capability

- Emission: Generates 13-bit sync break frame
- Reception: Detects 11-bit break frame

LIN slave mode

- Autonomous header handling - one single interrupt per valid message header
- Automatic baud rate synchronization - maximum tolerated initial clock deviation ±15%
- Sync delimiter checking
- 11-bit LIN sync break detection - break detection always active
- Parity check on the LIN identifier field
- LIN error management
- Hot plugging support

4.14.3 SPI

- Maximum speed: 10 Mbit/s (f_{MASTER}/2) both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on two lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- CRC calculation
- 1 byte Tx and Rx buffer
- Slave/master selection input pin

8 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated block of the memory. Except for the ROP (read-out protection) byte, each option byte has to be stored twice, in a regular form (OPTx) and a complemented one (NOPTx) for redundancy.

Option bytes can be modified in ICP mode (via SWIM) by accessing the EEPROM address shown in *Table 12: Option bytes* below. Option bytes can also be modified 'on the fly' by the application in IAP mode, except the ROP option that can only be modified in ICP mode (via SWIM).

Refer to the STM8S Flash programming manual (PM0051) and STM8 SWIM communication protocol and debug module user manual (UM0470) for information on SWIM programming procedures.

Table 13. Option byte description (continued)

Option byte no.	Description
OPTBL	**BL[7:0]** *Bootloader option byte* For STM8S products, this option is checked by the boot ROM code after reset. Depending on the content of addresses 0x487E, 0x487F, and 0x8000 (reset vector), the CPU jumps to the bootloader or to the reset vector. Refer to the UM0560 (STM8L/S bootloader manual) for more details. For STM8L products, the bootloader option bytes are on addresses 0xXXXX and 0xXXXX+1 (2 bytes). These option bytes control whether the bootloader is active or not. For more details, refer to the UM0560 (STM8L/S bootloader manual) for more details.

9 Unique ID

The devices feature a 96-bit unique device identifier which provides a reference number that is unique for any device and in any context. The 96 bits of the identifier can never be altered by the user.

The unique device identifier can be read in single bytes and may then be concatenated using a custom algorithm.

The unique device identifier is ideally suited:

- For use as serial numbers
- For use as security keys to increase the code security in the program memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the internal memory.
- To activate secure boot processes

		C = 10 pF, f_{OSC} = 24 MHz			6 (startup) 1.5 (stabilized)(3)	
g_m	Oscillator transconductance		5			mA/V
$t_{SU(HSE)}^{(4)}$	Startup time	V_{DD} is stabilized		1		ms

1. C is approximately equivalent to 2 x crystal Cload.
2. The oscillator selection can be optimized in terms of supply current using a high quality resonator with small R_m value. Refer to crystal manufacturer for more details
3. Data based on characterization results, not tested in production.
4. $t_{SU(HSE)}$ is the start-up time measured from the moment it is enabled (by software) to a stabilized 24 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

		Devices with external V_{REF+}/V_{REF-} pins	V_{REF-}		V_{REF+}	V
C_{ADC}	Internal sample and hold capacitor			3		pF
t_S(2)	Sampling time	f_{ADC} = 4 MHz	0.75			µs
		f_{ADC} = 6 MHz	0.5			
t_{STAB}	Wakeup time from standby			7		µs
t_{CONV}	Total conversion time (including sampling time, 10-bit resolution)	f_{ADC} = 4 MHz	3.5			µs
		f_{ADC} = 6 MHz	2.33			µs
			14			$1/f_{ADC}$

1. Data guaranteed by design, not tested in production.
2. During the sample time the input capacitance C_{AIN} (3 pF max) can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_S. After the end of the sample time t_S, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_S depend on programming.

11.2.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the order code (see *Figure 59: STM8S207xx/208xx performance line ordering information scheme(1) on page 112*).

The following example shows how to calculate the temperature range needed for a given application.

Assuming the following application conditions:

- Maximum ambient temperature T_{Amax}= 82 °C (measured according to JESD51-2)
- I_{DDmax} = 15 mA, V_{DD} = 5.5 V
- Maximum eight standard I/Os used at the same time in output at low level with I_{OL} = 10 mA, V_{OL}= 2 V
- Maximum four high sink I/Os used at the same time in output at low level with I_{OL} = 20 mA, V_{OL}= 1.5 V
- Maximum two true open drain I/Os used at the same time in output at low level with I_{OL} = 20 mA, V_{OL}= 2 V

  P_{INTmax} = 15 mA x 5.5 V = 82.5 mW

  P_{IOmax} = (10 mA x 2 V x 8) + (20 mA x 2 V x 2) + (20 mA x 1.5 V x 4) = 360 mW

  This gives: P_{INTmax} = 82.5 mW and P_{IOmax} 360 mW:

  P_{Dmax} = 82.5 mW + 360 mW

  Thus: P_{Dmax} = 443 mW

Using the values obtained in *Table 57: Thermal characteristics on page 108* T_{Jmax} is calculated as follows for LQFP64 10 x 10 mm = 46 °C/W:

T_{Jmax} = 82 °C + (46 °C/W x 443 mW) = 82 °C + 20 °C = 102 °C

This is within the range of the suffix 6 version parts (-40 < T_J < 105 °C).

In this case, parts must be ordered at least with the temperature range suffix 6.

12 STM8 development tools

Development tools for the STM8 microcontrollers include the full-featured STice emulation system supported by a complete software tool package including C compiler, assembler and integrated development environment with high-level language debugger. In addition, the STM8 is to be supported by a complete range of tools including starter kits, evaluation boards and a low-cost in-circuit debugger/programmer.

12.1 Emulation and in-circuit debugging tools

The STice emulation system offers a complete range of emulation and in-circuit debugging features on a platform that is designed for versatility and cost-effectiveness. In addition, STM8 application development is supported by a low-cost in-circuit debugger/programmer.

The STice is the fourth generation of full featured emulators from STMicroelectronics. It offers new advanced debugging capabilities including profiling and coverage to help detect and eliminate bottlenecks in application execution and dead code when fine tuning an application.

In addition, STice offers in-circuit debugging and programming of STM8 microcontrollers via the STM8 single wire interface module (SWIM), which allows non-intrusive debugging of an application while it runs on the target microcontroller.

For improved cost effectiveness, STice is based on a modular design that allows you to order exactly what you need to meet the development requirements and to adapt the emulation system to support existing and future ST microcontrollers.

STice key features

- Occurrence and time profiling and code coverage (new features)
- Advanced breakpoints with up to 4 levels of conditions
- Data breakpoints
- Program and data trace recording up to 128 KB records
- Read/write on the fly of memory during emulation
- In-circuit debugging/programming via SWIM protocol
- 8-bit probe analyzer
- 1 input and 2 output triggers
- Power supply follower managing application voltages between 1.62 to 5.5 V
- Modularity that allows you to specify the components you need to meet the development requirements and adapt to future requirements
- Supported by free software tools that include integrated development environment (IDE), programming software interface and assembler for STM8.
