What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	STM8
Core Size	8-Bit
Speed	24MHz
Connectivity	CANbus, I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	38
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	2K x 8
RAM Size	6K x 8
Voltage - Supply (Vcc/Vdd)	2.95V ~ 5.5V
Data Converters	A/D 10x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	48-LQFP
Supplier Device Package	48-LQFP (7x7)

2 Description

The STM8S20xxx performance line 8-bit microcontrollers offer from 32 to 128 Kbytes Flash program memory. They are referred to as high-density devices in the STM8S microcontroller family reference manual.

All STM8S20xxx devices provide the following benefits: reduced system cost, performance robustness, short development cycles, and product longevity.

The system cost is reduced thanks to an integrated true data EEPROM for up to 300 k write/erase cycles and a high system integration level with internal clock oscillators, watchdog, and brown-out reset.

Device performance is ensured by 20 MIPS at 24 MHz CPU clock frequency and enhanced characteristics which include robust I/O, independent watchdogs (with a separate clock source), and a clock security system.

Short development cycles are guaranteed due to application scalability across a common family product architecture with compatible pinout, memory map and modular peripherals. Full documentation is offered with a wide choice of development tools.

Product longevity is ensured in the STM8S family thanks to their advanced core which is made in a state-of-the art technology for applications with 2.95 V to 5.5 V operating supply.

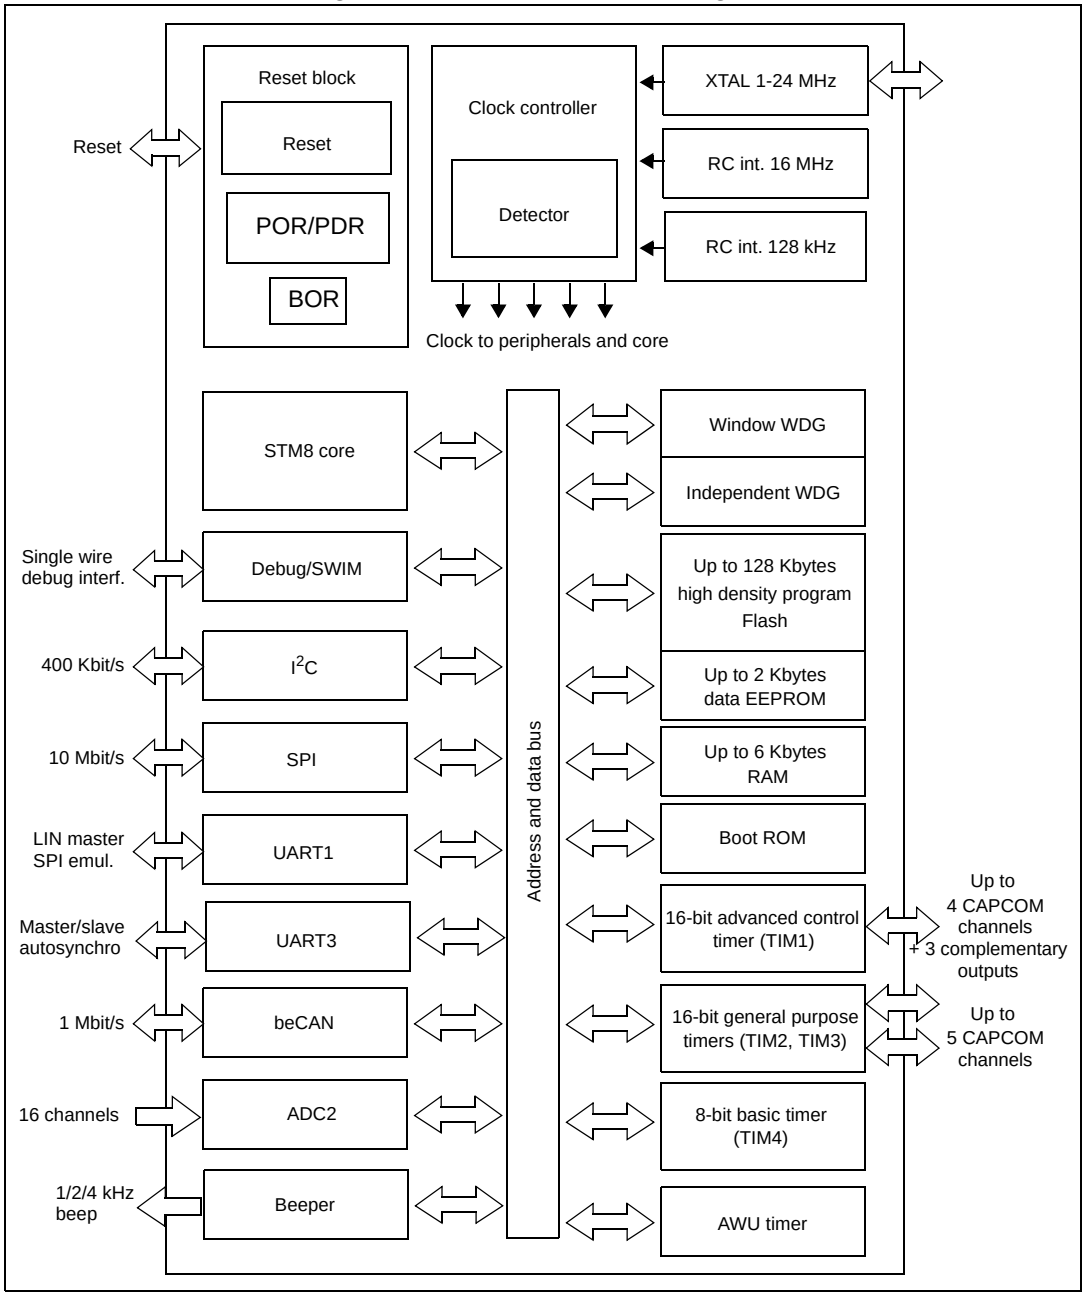
Figure 1. STM8S20xxx block diagram



1. Legend:
ADC: Analog-to-digital converter
beCAN: Controller area network
BOR: Brownout reset
I²C: Inter-integrated circuit multimaster interface
Independent WDG: Independent watchdog
POR/PDR: Power on reset / power down reset
SPI: Serial peripheral interface
SWIM: Single wire interface module
UART: Universal asynchronous receiver transmitter
Window WDG: Window watchdog

Independent watchdog timer

The independent watchdog peripheral can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the 128 kHz LSI internal RC clock source, and thus stays active even in case of a CPU clock failure

The IWDG time base spans from 60 µs to 1 s.

4.8 Auto wakeup counter

- Used for auto wakeup from active halt mode
- Clock source: Internal 128 kHz internal low frequency RC oscillator or external clock
- LSI clock can be internally connected to TIM3 input capture channel 1 for calibration

4.9 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

4.10 TIM1 - 16-bit advanced control timer

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and half-bridge driver

- 16-bit up, down and up/down autoreload counter with 16-bit prescaler
- Four independent capture/compare channels (CAPCOM) configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- Synchronization module to control the timer with external signals
- Break input to force the timer outputs into a defined state
- Three complementary outputs with adjustable dead time
- Encoder mode
- Interrupt sources: 3 x input capture/output compare, 1 x overflow/update, 1 x break

4.11 TIM2, TIM3 - 16-bit general purpose timers

- 16-bit autoreload (AR) up-counter
- 15-bit prescaler adjustable to fixed power of 2 ratios 1…32768
- Timers with 3 or 2 individually configurable capture/compare channels
- PWM mode
- Interrupt sources: 2 or 3 x input capture/output compare, 1 x overflow/update

4.12 TIM4 - 8-bit basic timer

- 8-bit autoreload, adjustable prescaler ratio to any power of 2 from 1 to 128
- Clock source: CPU clock
- Interrupt source: 1 x overflow/update

Table 4. TIM timer features

Timer	Counter size (bits)	Prescaler	Counting mode	CAPCOM channels	Complem. outputs	Ext. trigger	Timer synchr-onization/ chaining
TIM1	16	Any integer from 1 to 65536	Up/down	4	3	Yes	No
TIM2	16	Any power of 2 from 1 to 32768	Up	3	0	No	
TIM3	16	Any power of 2 from 1 to 32768	Up	2	0	No	
TIM4	8	Any power of 2 from 1 to 128	Up	0	0	No	

4.13 Analog-to-digital converter (ADC2)

STM8S20xxx performance line products contain a 10-bit successive approximation A/D converter (ADC2) with up to 16 multiplexed input channels and the following main features:

- Input voltage range: 0 to V_{DDA}
- Dedicated voltage reference (VREF) pins available on 80 and 64-pin devices
- Conversion time: 14 clock cycles
- Single and continuous modes
- External trigger input
- Trigger from TIM1 TRGO
- End of conversion (EOC) interrupt

4.14 Communication interfaces

The following communication interfaces are implemented:

- UART1: Full feature UART, SPI emulation, LIN2.1 master capability, Smartcard mode, IrDA mode, single wire mode.
- UART3: Full feature UART, LIN2.1 master/slave capability
- SPI: Full and half-duplex, 10 Mbit/s
- I^2C: Up to 400 Kbit/s
- beCAN (rev. 2.0A,B) - 3 Tx mailboxes - up to 1 Mbit/s

10 Electrical characteristics

10.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS}.

10.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at T_A = 25 °C and $T_A = T_{Amax}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean ± 3 Σ).

10.1.2 Typical values

Unless otherwise specified, typical data are based on T_A = 25 °C, V_{DD} = 5 V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean ± 2 Σ).

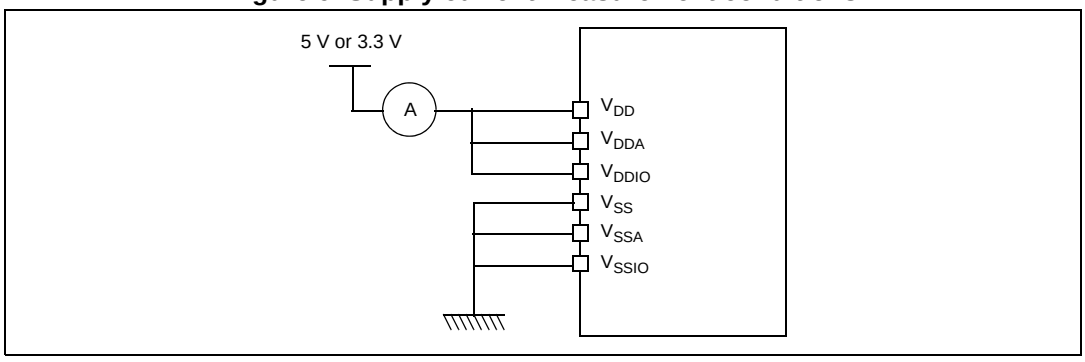
10.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

10.1.4 Typical current consumption

For typical current consumption measurements, V_{DD}, V_{DDIO} and V_{DDA} are connected together in the configuration shown in *Figure 9*.

Figure 9. Supply current measurement conditions



10.2 Absolute maximum ratings

Stresses above those listed as 'absolute maximum ratings' may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 15. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
V_{DDx} - V_{SS}	Supply voltage (including V_{DDA} and V_{DDIO})(1)	-0.3	6.5	V
V_{IN}	Input voltage on true open drain pins (PE1, PE2)(2)	V_{SS} - 0.3	6.5	
	Input voltage on any other pin(2)	V_{SS} - 0.3	V_{DD} + 0.3	
$\lvert V_{DDx} - V_{DD} \rvert$	Variations between different power pins		50	mV
$\lvert V_{SSx} - V_{SS} \rvert$	Variations between all the different ground pins		50	
V_{ESD}	Electrostatic discharge voltage	see *Absolute maximum ratings (electrical sensitivity) on page 89*		

1. All power (V_{DD}, V_{DDIO}, V_{DDA}) and ground (V_{SS}, V_{SSIO}, V_{SSA}) pins must always be connected to the external power supply
2. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN}>V_{DD}$ while a negative injection is induced by $V_{IN}<V_{SS}$. For true open-drain pads, there is no positive injection current, and the corresponding V_{IN} maximum must always be respected

10.3 Operating conditions

The device must be used in operating conditions that respect the parameters in *Table 18*. In addition, full account must be taken of all physical capacitor characteristics and tolerances.

Table 18. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f_{CPU}	Internal CPU clock frequency	$T_A \leq$ 105 °C	0	24	MHz
			0	16	MHz
V_{DD}/V_{DD_IO}	Standard operating voltage		2.95	5.5	V
V_{CAP}(1)	C_{EXT}: capacitance of external capacitor		470	3300	nF
	ESR of external capacitor	at 1 MHz(2)	-	0.3	Ω
	ESL of external capacitor		-	15	nH
P_D(3)	Power dissipation at T_A = 85° C for suffix 6 or T_A = 125° C for suffix 3	44, 48, 64, and 80-pin devices, with output on 8 standard ports, 2 high sink ports and 2 open drain ports simultaneously(4)		443	mW
		32-pin package, with output on 8 standard ports and 2 high sink ports simultaneously(4)		360	
T_A	Ambient temperature for 6 suffix version	Maximum power dissipation	-40	85	°C
	Ambient temperature for 3 suffix version	Maximum power dissipation	-40	125	
T_J	Junction temperature range	6 suffix version	-40	105	
		3 suffix version	-40	130(5)	

1. Care should be taken when selecting the capacitor, due to its tolerance, as well as the parameter dependency on temperature, DC bias and frequency in addition to other factors. The parameter maximum value must be respected for the full application range.
2. This frequency of 1 MHz as a condition for V_{CAP} parameters is given by design of internal regulator.
3. To calculate $P_{Dmax}(T_A)$, use the formula $P_{Dmax} = (T_{Jmax} - T_A)/\Theta_{JA}$ (see *Section 11.2: Thermal characteristics on page 108*) with the value for T_{Jmax} given in *Table 18* above and the value for Θ_{JA} given in *Table 57: Thermal characteristics*.
4. Refer to *Section 11.2: Thermal characteristics on page 108* for the calculation method.
5. T_{Jmax} is given by the test limit. Above this value the product behavior is not guaranteed.

Current consumption curves

Figure 14 and *Figure 15* show typical current consumption measured with code executing in RAM.

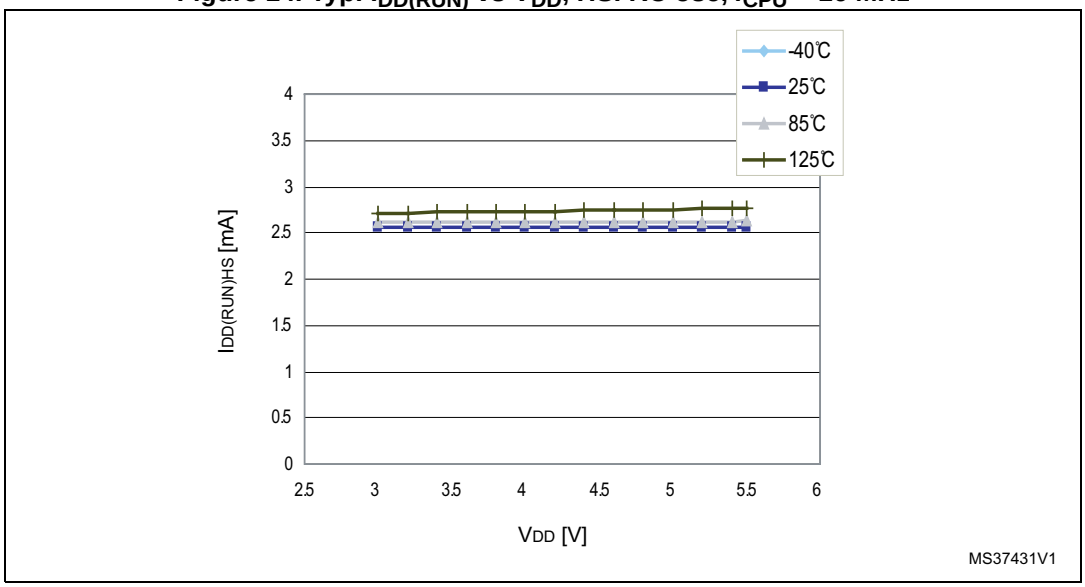

Figure 15. Typ. $I_{DD(WFI)}$ vs V_{DD}, HSI RC osc, f_{CPU} = 16 MHz

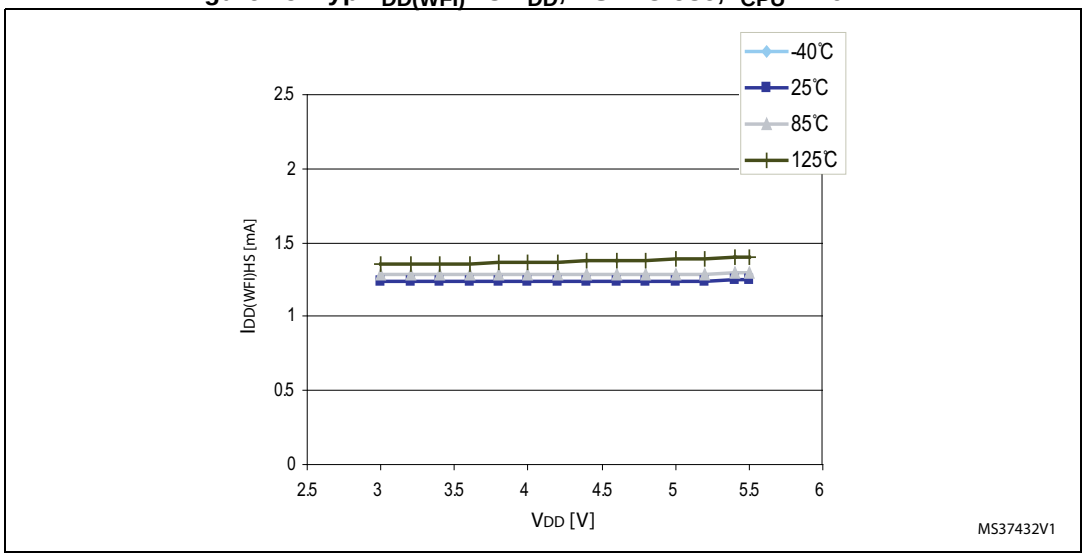

10.3.8 SPI serial peripheral interface

Unless otherwise specified, the parameters given in *Table 42* are derived from tests performed under ambient temperature, f_{MASTER} frequency and V_{DD} supply voltage conditions. $t_{MASTER} = 1/f_{MASTER}$.

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

Table 42. SPI characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
f_{SCK} $1/t_{c(SCK)}$	SPI clock frequency	Master mode	0	10	MHz

$t_{dis(SO)}$ (1)(3)	Data output disable time	Slave mode	25		
$t_{v(SO)}$ (1)	Data output valid time	Slave mode (after enable edge)		75	
$t_{v(MO)}$ (1)	Data output valid time	Master mode (after enable edge)		30	
$t_{h(SO)}$ (1)	Data output hold time	Slave mode (after enable edge)	31		
$t_{h(MO)}$ (1)		Master mode (after enable edge)	12		

1. Values based on design simulation and/or characterization results, and not tested in production.
2. Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.
3. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z.

1. f_{MASTER}, must be at least 8 MHz to achieve max fast I^2C speed (400kHz)
2. Data based on standard I^2C protocol requirement, not tested in production
3. The maximum hold time of the start condition has only to be met if the interface does not stretch the low time
4. The device must internally provide a hold time of at least 300 ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL

12 STM8 development tools

Development tools for the STM8 microcontrollers include the full-featured STice emulation system supported by a complete software tool package including C compiler, assembler and integrated development environment with high-level language debugger. In addition, the STM8 is to be supported by a complete range of tools including starter kits, evaluation boards and a low-cost in-circuit debugger/programmer.

12.1 Emulation and in-circuit debugging tools

The STice emulation system offers a complete range of emulation and in-circuit debugging features on a platform that is designed for versatility and cost-effectiveness. In addition, STM8 application development is supported by a low-cost in-circuit debugger/programmer.

The STice is the fourth generation of full featured emulators from STMicroelectronics. It offers new advanced debugging capabilities including profiling and coverage to help detect and eliminate bottlenecks in application execution and dead code when fine tuning an application.

In addition, STice offers in-circuit debugging and programming of STM8 microcontrollers via the STM8 single wire interface module (SWIM), which allows non-intrusive debugging of an application while it runs on the target microcontroller.

For improved cost effectiveness, STice is based on a modular design that allows you to order exactly what you need to meet the development requirements and to adapt the emulation system to support existing and future ST microcontrollers.

STice key features

- Occurrence and time profiling and code coverage (new features)
- Advanced breakpoints with up to 4 levels of conditions
- Data breakpoints
- Program and data trace recording up to 128 KB records
- Read/write on the fly of memory during emulation
- In-circuit debugging/programming via SWIM protocol
- 8-bit probe analyzer
- 1 input and 2 output triggers
- Power supply follower managing application voltages between 1.62 to 5.5 V
- Modularity that allows you to specify the components you need to meet the development requirements and adapt to future requirements
- Supported by free software tools that include integrated development environment (IDE), programming software interface and assembler for STM8.

Table 58. Document revision history (continued)

Date	Revision	Changes
10-Jul-2009	8 cont'd	*Section 10: Electrical characteristics*: Added data for TBD values; updated *Table 15: Voltage characteristics* and *Table 18: General operating conditions*; updated VCAP specifications in *Table 18* and in *Section 10.3.1: VCAP external capacitor*; updated *Figure 18*; replaced *Figure 19*; updated *Table 35: RAM and hardware registers*; updated *Figure 22* and *Figure 35*; added *Figure 40: Typical application with I2C bus and timing diagram*. Removed *Table 56: Junction temperature range.* Added link between ordering information *Figure 59* and STM8S20xx features *Table 2*.
13-Apr-2010	9	Document status changed from "preliminary data" to "datasheet". *Table 2: STM8S20xxx performance line features*: high sink I/O for STM8S207C8 is 16 (not 13). *Table 3: Peripheral clock gating bit assignments in CLK_PCKENR1/2 registers*: updated bit positions for TIM2 and TIM3. *Figure 5: LQFP 48-pin pinout*: added CAN_TX and CAN_RX to pins 35 and 36; noted that these pins are available only in STM8S208xx devices. *Figure 7: LQFP 32-pin pinout*: replaced uart2 with uart3. *Table 6: Pin description*: added footnotes concerning beCAN availability and UART1_RX and UART3_RX pins. *Table 13: Option byte description*: added description of STM8L bootloader option bytes to the option byte description table. Added *Section 9: Unique ID* (and listed this attribute in *Features*). *Section 10.3: Operating conditions*: added introductory text. *Table 18: General operating conditions*: replaced "C_{EXT}" with "VCAP" and added data for ESR and ESL; removed "low power dissipation" condition for T_A. *Table 26: Total current consumption in halt mode at VDD = 5 V*: replaced max value of $I_{DD(H)}$ at 85 °C from 30 µA to 35 µA for the condition "Flash in power-down mode, HSI clock after wakeup". *Table 33: HSI oscillator characteristics*: updated the ACC_{HSI} factory calibrated values. *Functional EMS (electromagnetic susceptibility)* and *Table 47*: replaced "IEC 1000" with "IEC 61000". *Electromagnetic interference (EMI)* and *Table 48*: replaced "SAE J1752/3" with "IEC 61967-2". *Table 57: Thermal characteristics*: changed the thermal resistance junction-ambient value of LQFP32 (7x7 mm) from 59 °C/W to 60 °C/W.
