Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

5 Power Dissipation

Table 5 provides information on power dissipation. The modes are 1:1, where CPU and bus speeds are equal, and 2:1, where CPU frequency is twice bus speed.

Table 5. Power Dissipation (P_D)

Die Revision	Bus Mode	CPU Frequency	Typical[1]	Maximum[2]	Unit
0	1:1	66 MHz	310	390	mW
		80 MHz	350	430	mW
	2:1	133 MHz	430	495	mW

1 Typical power dissipation at V_{DDL} = V_{DDSYN} = 1.8 V, and V_{DDH} is at 3.3 V.
2 Maximum power dissipation at V_{DDL} = V_{DDSYN} = 1.9 V, and V_{DDH} is at 3.5 V.

NOTE

The values in Table 5 represent V_{DDL}-based power dissipation and do not include I/O power dissipation over V_{DDH}. I/O power dissipation varies widely by application due to buffer current, depending on external circuitry.

The V_{DDSYN} power dissipation is negligible.

1 For part speeds above 50 MHz, use 9.80 ns for B11a.

2 The timing required for $\overline{\text{BR}}$ input is relevant when the MPC885/MPC880 is selected to work with the internal bus arbiter. The timing for $\overline{\text{BG}}$ input is relevant when the MPC885/MPC880 is selected to work with the external bus arbiter.

3 For part speeds above 50 MHz, use 2 ns for B17.

4 The D(0:31) input timings B18 and B19 refer to the rising edge of the CLKOUT in which the $\overline{\text{TA}}$ input signal is asserted.

5 For part speeds above 50 MHz, use 2 ns for B19.

6 The D(0:31) input timings B20 and B21 refer to the falling edge of the CLKOUT. This timing is valid only for read accesses controlled by chip-selects under control of the user-programmable machine (UPM) in the memory controller, for data beats where DLT3 = 1 in the RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.)

7 This formula applies to bus operation up to 50 MHz.

8 The timing B30 refers to $\overline{\text{CS}}$ when ACS = 00 and to $\overline{\text{CS}}$ and $\overline{\text{WE}}$(0:3) when CSNT = 0.

9 The signal UPWAIT is considered asynchronous to the CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals as described in Figure 21.

10 The $\overline{\text{AS}}$ signal is considered asynchronous to the CLKOUT. The timing B39 is specified in order to allow the behavior specified in Figure 24.

15 FEC Electrical Characteristics

This section provides the AC electrical specifications for the fast Ethernet controller (FEC). Note that the timing specifications for the MII signals are independent of system clock frequency (part speed designation). Also, MII signals use TTL signal levels compatible with devices operating at either 5.0 or 3.3 V.

15.1 MII and Reduced MII Receive Signal Timing

The receiver functions correctly up to a MII_RX_CLK maximum frequency of 25 MHz + 1%. The reduced MII (RMII) receiver functions correctly up to a RMII_REFCLK maximum frequency of 50 MHz + 1%. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed the MII_RX_CLK frequency – 1%.

Table 34 provides information on the MII and RMII receive signal timing.
