### Understanding Embedded - PLDs (Programmable Logic Devices)

Embedded - PLDs, or Programmable Logic Devices, are a type of digital electronic component used to build reconfigurable digital circuits. Unlike fixed-function logic devices, PLDs can be programmed to perform specific functions by the user. This flexibility allows designers to customize the logic to meet the exact needs of their applications, making PLDs a crucial component in modern embedded systems.

### Applications of Embedded - PLDs (Programmable Logic Devices)

The versatility of PLDs makes them suitable for a wide range of applications. In consumer electronics, PLDs are used to enhance the functionality and performance of

#### Details

Product Status	Obsolete
Programmable Type	EE PLD
Number of Macrocells	10
Voltage - Input	3.3V
Speed	15 ns
Mounting Type	Surface Mount
Package / Case	28-LCC (J-Lead)
Supplier Device Package	28-PLCC (11.51x11.51)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/atf22lv10c-15jc">https://www.e-xfl.com/product-detail/microchip-technology/atf22lv10c-15jc</a>

## Features

- 3.0V to 5.5V Operating Range
- Advanced Low-voltage Electrically-erasable Programmable Logic Device
- User-controlled Power-down Pin Option
- Pin-controlled Standby Power (10 $\mu$ A Typical)
- Well-suited for Battery Powered Systems
- 10ns Maximum Propagation Delay
- CMOS and TTL Compatible Inputs and Outputs
- Latch Feature Hold Inputs to Previous Logic States
- Advanced Electrically-erasable Technology
  - Reprogrammable
  - 100% Tested
- High-reliability CMOS Process
  - 20 year Data Retention
  - 100 Erase/Write Cycles
  - 2,000V ESD Protection
  - 200mA Latchup Immunity
- Industrial Temperature Ranges
- Dual-in-line and Surface Mount Packages in Standard Pinouts
- Inputs are 5V Tolerant
- Green Package Options (Pb/Halide-free/RoHS Compliant) Available
- Applications include Glue logic for 3.3V systems, DMA Control, State Machine Control, Graphics processing

## 1. Description

The Atmel<sup>®</sup> ATF22LV10C is a high-performance CMOS (electrically erasable) programmable logic device (PLD) that utilizes the Atmel proven electrically erasable Flash memory technology. Speeds down to 10ns and power dissipation as low as 10mA are offered. All speed ranges are specified over the 3.0V to 5.5V range for industrial and commercial temperature ranges.

The ATF22LV10C provides a low-voltage and user controlled “zero” power CMOS PLD solution. A user-controlled power-down feature offers “zero” (10 $\mu$ A typical) standby power. This feature allows the user to manage total system power to meet specific application requirements and enhance reliability, all without sacrificing speed. (The Atmel ATF22LV10CQZ provides edge-sensing “zero” standby power (3 $\mu$ A typical), as well as low voltage operation. See the ATF22LV10CQZ datasheet.)

The ATF22LV10C is capable of operating at supply voltages down to 3.0V. When the power-down pin is active, the device is placed into a zero standby power-down mode. When the power-down pin is not used or active, the device operates in a full power low voltage mode. Pin “keeper” circuits on input and output pins hold pins to their previous logic levels when idle, which eliminate static power consumed by pull-up resistors.

The ATF22LV10C macrocell incorporates a variable product term architecture. Each output is allocated from 8 to 16 product terms which allows highly-complex logic functions to be realized. Two additional product terms are included to provide synchronous reset and asynchronous reset. These additional product terms are common to all ten registers and are automatically cleared upon power-up. Register preload simplifies testing. A security fuse prevents unauthorized copying of programmed fuse patterns.

## High-performance Electrically Erasable Programmable Logic Device

### Atmel ATF22LV10C

See separate datasheet for Atmel  
ATF22LV10C(Q)Z option

**Figure 1-1. Block Diagram**

**Figure 1-2. Pin Configurations**

Pin Configurations (All Pinouts Top View)

Pin Name	Function
CLK	Clock
IN	Logic Inputs
I/O	Bi-directional Buffers
VCC	(3V to 5.5V) Supply
PD	Programmable Power-down

**Figure 1-3. TSSOP**

**Figure 1-4. DIP/SOIC**

**Figure 1-5. PLCC**

Note: For PLCC, pins 1, 8, 15, and 22 can be left unconnected. For superior performance, connect VCC to pin 1 and GND to 8, 15, and 22

## 2. Absolute Maximum Ratings\*

Temperature Under Bias .....	-40°C to +85°C
Storage Temperature.....	-65°C to +150°C
Voltage on Any Pin with Respect to Ground.....	-2.0V to +7.0V <sup>(1)</sup>
Voltage on Input Pins with Respect to Ground During Programming.....	-2.0V to +14.0V <sup>(1)</sup>
Programming Voltage with Respect to Ground.....	-2.0V to +14.0V <sup>(1)</sup>

**\*NOTICE:** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note:** 1. Minimum voltage is -0.6V DC, which may undershoot to -2.0V for pulses of less than 20ns. Maximum output pin voltage is  $V_{CC} + 0.75V$  DC, which may overshoot to 7.0V for pulses of less than 20ns.

## 3. DC and AC Operating Conditions

	Commercial	Industrial
Operating Temperature (Ambient)	0°C - 70°C	-40°C - 85°C
$V_{CC}$ Power Supply	3.0V - 5.5V	3.0V - 5.5V

### 3.1 DC Characteristics

Symbol	Parameter	Condition <sup>(2)</sup>	Min	Typ	Max	Units
$I_{IL}$	Input or I/O Low Leakage Current	$0 \leq V_{IN} \leq V_{IL}(\text{Max})$			-10	$\mu A$
$I_{IH}$	Input or I/O High Leakage Current	$(V_{CC} - 0.2)V \leq V_{IN} \leq V_{CC}$			10	$\mu A$
$I_{CC}$	Power Supply Current	$V_{CC} = \text{Max}$ , $V_{IN} = \text{Max}$ Outputs Open	Com. Ind.	55 60	85 90	mA mA
$I_{CC2}$	Clocked Power Supply Current	$V_{CC} = \text{Max}$ Outputs Open, $f = 15\text{MHz}$	Com. Ind.		100 105	mA mA
$I_{PD}$	Power Supply Current, Power-down Mode	$V_{CC} = 3.6V$ , Max $V_{IN} = 0$ , Outputs Open	Com. Ind.	10 10	100 120	$\mu A$ $\mu A$
$I_{OS}^{(1)}$	Output Short Circuit Current	$V_{OUT} = 0.5V$			-130	mA
$V_{IL}$	Input Low Voltage		-0.5		0.8	V
$V_{IH}$	Input High Voltage		2.0		$V_{CC} + 0.75$	V
$V_{OL}$	Output Low Voltage	$V_{IN} = V_{IH}$ or $V_{IL}$ $V_{CC} = \text{Min}$ $I_{OL} = 16\text{mA}$			0.5	V
$V_{OH}$	Output High Voltage	$V_{IN} = V_{IH}$ or $V_{IL}$ $V_{CC} = \text{Min}$ $I_{OH} = -2.0\text{mA}$	2.4			V
$V_{OH}$	Output High Voltage	$I_{OH} = -100\mu A$	$V_{CC} - 0.2V$			V

Notes: 1. Not more than one output at a time should be shorted. Duration of short circuit test should not exceed 30 sec  
2. For DC characteristics, the test condition of  $V_{CC} = \text{Max}$  corresponds to 3.6V

### 3.2 AC Waveforms

### 3.3 AC Characteristics(1)

Symbol	Parameter	-10		-15		Units
		Min	Max	Min	Max	
$t_{PD}$	Input or Feedback to Non-Registered Output	3	10	3	15	ns
$t_{CF}$	Clock to Feedback		5		8	ns
$t_{CO}$	Clock to Output	2	6.5	2	10	ns
$t_S$	Input or Feedback Setup Time	7.5		12		ns
$t_H$	Input Hold Time	0		0		ns
$t_P$	Clock Period	12		16		ns
$t_W$	Clock Width	6		8		ns
$f_{MAX}$	External Feedback $1/(t_S + t_{CO})$		71.4		45.5	MHz
	Internal Feedback $1/(t_S + t_{CF})$		80		50	MHz
	No Feedback $1/(t_P)$		83.3		62.5	MHz
$t_{EA}$	Input to Output Enable	3	12	3	15	ns
$t_{ER}$	Input to Output Disable	2	12	2	15	ns
$t_{AP}$	Input or I/O to Asynchronous Reset of Register	3	13	3	15	ns
$t_{SP}$	Setup Time, Synchronous Preset	10		10		ns
$t_{AW}$	Asynchronous Reset Width	8		8		ns
$t_{AR}$	Asynchronous Reset Recovery Time	6		6		ns
$t_{SPR}$	Synchronous Preset to Clock Recovery Time	10		10		ns

Note: 1. See ordering information for valid part numbers

## 3.4 Power-down AC Characteristics

Symbol	Parameter	-10		-15		Units
		Min	Max	Min	Max	
$t_{IVDH}$	Valid Input before PD High	10		15		ns
$t_{GVDH}$	Valid $\overline{OE}$ before PD High	0		0		ns
$t_{CVDH}$	Valid Clock before PD High	0		0		ns
$t_{DHIX}$	Input Don't Care after PD High		10		15	ns
$t_{DHGX}$	$\overline{OE}$ Don't Care after PD High		10		15	ns
$t_{DHCX}$	Clock Don't Care after PD High		10		15	ns
$t_{DLIV}$	PD Low to Valid Input		10		15	ns
$t_{DLGV}$	PD Low to Valid $\overline{OE}$		25		30	ns
$t_{DLCV}$	PD Low to Valid Clock		25		30	ns
$t_{DLOV}$	PD Low to Valid Output		30		35	ns

## 3.5 Input Test Waveforms and Measurement Levels

$$t_R, t_F < 1.5\text{ns}$$

## 3.6 Output Test Loads

Note: Similar competitor devices are specified with slightly different loads. These load differences may affect output signals' delay and slew rate. Atmel® devices are tested with sufficient margins to meet compatible device specification conditions.

**Table 3-1.** Pin Capacitance (f = 1MHz, T = 25°C<sup>(1)</sup>)

	Typ	Max	Units	Conditions
$C_{IN}$	5	8	pF	$V_{IN} = 0V$
$C_{OUT}$	6	8	pF	$V_{OUT} = 0V$

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested

### 3.7 Power-up Reset

The registers in the Atmel® ATF22LV10C are designed to reset during power-up. At a point delayed slightly from  $V_{CC}$  crossing  $V_{RST}$ , all registers will be reset to the low state. The output state will depend on the polarity of the buffer.

This feature is critical for state machine initialization. However, due to the asynchronous nature of reset and the uncertainty of how  $V_{CC}$  actually rises in the system, the following conditions are required:

1. The  $V_{CC}$  rise must be monotonic and start below 0.7V
2. The clock must remain stable during  $T_{PR}$
3. After  $T_{PR}$ , all input and feedback setup times must be met before driving the clock pin high

### 3.8 Preload of Register Outputs

The ATF22LV10C registers are provided with circuitry to allow loading of each register with either a high or a low. This feature will simplify testing since any state can be forced into the registers to control test sequencing. A JEDEC file with preload is generated when a source file with vectors is compiled. Once downloaded, the JEDEC file preload sequence will be done automatically by most of the approved programmers after the programming.

## 4. Electronic Signature Word

There are 64-bits of programmable memory that are always available to the user, even if the device is secured. These bits can be used for user-specific data.

## 5. Security Fuse Usage

A single fuse is provided to prevent unauthorized copying of the ATF22LV10C fuse patterns. Once programmed, fuse verify and preload are inhibited. However, the 64-bit User Signature remains accessible.

The security fuse should be programmed last, as its effect is immediate.

## 6. Programming/Erasing

Programming/erasing is performed using standard PLD programmers. See CMOS PLD Programming Hardware & Software Support for information on software/programming.

**Table 6-1.** Programming/Erasing

Parameter	Description	Typ	Max	Units
$T_{PR}$	Power-up Reset Time	600	1,000	ns
$V_{RST}$	Power-up Reset Voltage	2.5	3.0	V

## 7. Input and I/O Pin-keeper

All ATF22V10C family members have internal input and I/O pin-keeper circuits. Therefore, whenever inputs or I/Os are not being driven externally, they will maintain their last driven state. This ensures that all logic array inputs and device outputs are at known states. These are relatively weak active circuits that can be easily overridden by TTL-compatible drivers (see Input and I/O diagrams on [page 7](#)).

## 8. Power-down Mode

The Atmel® ATF22LV10C includes an optional pin controlled power-down feature. When this mode is enabled, the PD pin acts as the power-down pin (Pin 4 on the DIP/SOIC packages and Pin 5 on the PLCC package). When the PD pin is high, the device supply current is reduced to less than 100mA. During power-down, all output data and internal logic states are latched and held. Therefore, all registered and combinatorial output data remain valid. Any outputs which were in an undetermined state at the onset of power-down will remain at the same state. During power-down, all input signals except the power-down pin are blocked. Input and I/O hold latches remain active to insure that pins do not float to indeterminate levels, further reducing system power. The power-down pin feature is enabled in the logic design file. Designs using the power-down pin may not use the PD pin logic array input. However, all other PD pin macrocell resources may still be used, including the buried feedback and foldback product term array inputs.

PD pin configuration is controlled by the design file, and appears as a separate fuse bit in the JEDEC file. When the power-down feature is not specified in the design file, the IN/PD pin will be configured as a regular logic input.

Note: Some programmers list the 22V10 JEDEC-compatible 22V10C (no PD used) separately from the non-22V10 JEDEC-compatible 22V10CEX (with PD used).

**Figure 8-1.** Input Diagram

**Figure 8-2.** I/O Diagram

## 9. Compiler Mode Selection

**Table 9-1.** Compiler Mode Selection

	<b>PAL Mode (5828 Fuses)</b>	<b>GAL Mode (5892 Fuses)</b>	<b>Power-down Mode<sup>(1)</sup> (5893 Fuses)</b>
Synario	Atmel ATF22C10C (DIP) Atmel ATF22V10C (PLCC)	Atmel ATF22C10C DIO (UES) Atmel ATF22V10C PLCC (UES)	Atmel ATF22C10C DIP (PWD) Atmel ATF22C10V PLCC (PWD)
WINCUPL	P22V10 P22V10LCC	G22V10 G22V10LCC	G22V10CP G22V10CPLCC

Note: 1. These device types will create a JEDEC file which when programmed in an Atmel ATF22V10C device will enable the power-down mode feature. All other devices have this feature disabled.

## 10. Functional Logic Diagram Description

The functional logic diagram describes the Atmel® ATF22LV10C architecture.

The ATF22LV10C has twelve inputs and ten I/O macrocells. Each macrocell can be configured into one of four output configurations: active high/low, registered/combinatorial output. The universal architecture of the ATF22LV10C can be programmed to emulate most 24-pin PAL devices.

Unused product terms are automatically disabled by the compiler to decrease power consumption. A security fuse, when programmed, protects the contents of the ATF22LV10C. Eight bytes (64-fuses) of User Signature are accessible to the user for purposes such as storing project name, part number, revision or date. The User Signature is accessible regardless of the state of the security fuse.

## 11. Ordering Information

### 11.1 Ordering Code Detail

$t_{PD}$ (ns)	$t_S$ (ns)	$t_{CO}$ (ns)	Ordering Code	Package	Operation Range
10	7.5	7.5	ATF22LV10C-10JC	28J	Commercial (0°C to 70°C)
			ATF22LV10C-10PC	24P3	
			ATF22LV10C-10SC	24S	
			ATF22LV10C-10XC	24X	
10	7.5	7.5	ATF22LV10C-10JI	28J	Industrial (0°C to 85°C)
			ATF22LV10C-10PI	24P3	
			ATF22LV10C-10SI	24S	
			ATF22LV10C-10XI	24X	
15	12	10	ATF22LV10C-15JC	28J	Commercial (0°C to 70°C)
			ATF22LV10C-15PC	24P3	
			ATF22LV10C-15SC	24S	
			ATF22LV10C-15XC	24X	
15	12	10	ATF22LV10C-15JI	28J	Industrial (-40°C to +85°C)
			ATF22LV10C-15PI	24P3	
			ATF22LV10C-15SI	24S	
			ATF22LV10C-15XI	24X	

Note: Lead based packages will become obsolete, and are not recommended for new designs

### 11.2 Green Package Options (Pb/Halide-free/RoHS Compliant)

$t_{PD}$ (ns)	$t_S$ (ns)	$t_{CO}$ (ns)	Ordering Code	Package	Operation Range
10	7.5	7.5	ATF22LV10C-10JU	28J	Industrial (0°C to +85°C)
			ATF22LV10C-10PU	24P3	
			ATF22LV10C-10SU	24S	
			ATF22LV10C-10XU	24X	

### 11.3 Using “C” Product for Industrial

To use commercial product for industrial temperature ranges, simply de-rate  $I_{CC}$  by 15% on the “C” device. No speed de-rating is necessary.

Package Type	
<b>28J</b>	28-lead, Plastic J-leaded Chip Carrier (PLCC)
<b>24P3</b>	24-lead, 0.300" Wide, Plastic Dual In-line Package (PDIP)
<b>24S</b>	24-lead, 0.300" Wide, Plastic Gull Wing Small Outline (SOIC)
<b>24X</b>	24-lead, 4.4mm Wide, Plastic Thin Shrink Small Outline (TSSOP)

## 12. Package Information

### 12.1 28J – PLCC

**COMMON DIMENSIONS**  
(Unit of Measure = mm)
