

Welcome to [E-XFL.COM](#)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	20MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, LCD, POR, PWM, WDT
Number of I/O	25
Program Memory Size	7KB (4K x 14)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 11x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.300", 7.62mm)
Supplier Device Package	28-SPDIP
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic16lf1903-i-sp">https://www.e-xfl.com/product-detail/microchip-technology/pic16lf1903-i-sp</a>

FIGURE 2: 28-PIN UQFN

# PIC16LF1902/3

**TABLE 1-2: PIC16LF1902/3 PINOUT DESCRIPTION**

Name	Function	Input Type	Output Type	Description
RA0/AN0/SEG12	RA0	TTL	CMOS	General purpose I/O.
	AN0	AN	—	A/D Channel 0 input.
	SEG12	—	AN	LCD Analog output.
RA1/AN1/SEG7	RA1	TTL	CMOS	General purpose I/O.
	AN1	AN	—	A/D Channel 1 input.
	SEG7	—	AN	LCD Analog output.
RA2/AN2/COM2	RA2	TTL	CMOS	General purpose I/O.
	AN2	AN	—	A/D Channel 2 input.
	COM2	—	AN	LCD Analog output.
RA3/AN3/VREF+/COM3/SEG15	RA3	TTL	CMOS	General purpose I/O.
	AN3	AN	—	A/D Channel 3 input.
	VREF+	AN	—	A/D Voltage Reference input.
	COM3	—	AN	LCD Analog output.
	SEG15	—	AN	LCD Analog output.
RA4/T0CKI/SEG4	RA4	TTL	CMOS	General purpose I/O.
	T0CKI	ST	—	Timer0 clock input.
	SEG4	—	AN	LCD Analog output.
RA5/AN4/SEG5	RA5	TTL	CMOS	General purpose I/O.
	AN4	AN	—	A/D Channel 4 input.
	SEG5	—	AN	LCD Analog output.
RA6/CLKOUT/SEG1	RA6	TTL	CMOS	General purpose I/O.
	CLKOUT	—	CMOS	Fosc/4 output.
	SEG1	—	AN	LCD Analog output.
RA7/CLKIN/SEG2	RA7	TTL	CMOS	General purpose I/O.
	CLKIN	CMOS	—	External clock input (EC mode).
	SEG2	—	AN	LCD Analog output.
RB0/AN12/INT/SEG0	RB0	TTL	CMOS	General purpose I/O.
	AN12	AN	—	A/D Channel 12 input.
	INT	ST	—	External interrupt.
	SEG0	—	AN	LCD Analog output.
RB1 <sup>(1)</sup> /AN10/SEG24/VLCD1	RB1	TTL	CMOS	General purpose I/O.
	AN10	AN	—	A/D Channel 10 input.
	SEG24	—	AN	LCD Analog output.
	VLCD1	AN	—	LCD analog input.
RB2 <sup>(1)</sup> /AN8/SEG25/VLCD2	RB2	TTL	CMOS	General purpose I/O.
	AN8	AN	—	A/D Channel 8 input.
	SEG25	—	AN	LCD Analog output.
	VLCD2	AN	—	LCD analog input.
RB3 <sup>(1)</sup> /AN9/SEG26/VLCD3	RB3	TTL	CMOS	General purpose I/O.
	AN9	AN	—	A/D Channel 9 input.
	SEG26	—	AN	LCD Analog output.
	VLCD3	AN	—	LCD analog input.

**Legend:** AN = Analog input or output    CMOS = CMOS compatible input or output    OD = Open-Drain  
TTL = TTL compatible input    ST = Schmitt Trigger input with CMOS levels    I<sup>2</sup>C = Schmitt Trigger input with I<sup>2</sup>C levels  
HV = High Voltage    XTAL = Crystal

**Note 1:** These pins have interrupt-on-change functionality.

**TABLE 3-5: SPECIAL FUNCTION REGISTER SUMMARY (CONTINUED)**

Addr	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR, BOR	Value on all other Resets

**Legend:** x = unknown, u = unchanged, q = value depends on condition, - = unimplemented, read as '0', r = reserved.  
Shaded locations are unimplemented, read as '0'.

**Note 1:** These registers can be addressed from any bank.  
**Note 2:** Unimplemented, read as '1'.

## 4.5 Device ID and Revision ID

The memory location 8006h is where the Device ID and Revision ID are stored. The upper nine bits hold the Device ID. The lower five bits hold the Revision ID. See **Section 10.4 “User ID, Device ID and Configuration Word Access”** for more information on accessing these memory locations.

Development tools, such as device programmers and debuggers, may be used to read the Device ID and Revision ID.

### REGISTER 4-3: DEVICEID: DEVICE ID REGISTER

R	R	R	R	R	R
DEV<8:3>					
bit 13			bit 8		

R	R	R	R	R	R	R	R
DEV<2:0>			REV<4:0>				
bit 7			bit 0				

#### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as ‘1’
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
‘1’ = Bit is set	‘0’ = Bit is cleared	P = Programmable bit

bit 13-5 **DEV<8:0>**: Device ID bits

Device	DEVICEID<13:0> Values	
	DEV<8:0>	REV<4:0>
PIC16LF1902	01 1100 001	x xxxx
PIC16LF1903	01 1100 000	x xxxx

bit 4-0 **REV<4:0>**: Revision ID bits

These bits are used to identify the revision (see Table under DEV<8:0> above).

# PIC16LF1902/3

## 5.0 RESETS

There are multiple ways to reset this device:

- Power-on Reset (POR)
- Brown-out Reset (BOR)
- Low-Power Brown-out Reset (LPBOR)
- MCLR Reset
- WDT Reset
- RESET instruction
- Stack Overflow
- Stack Underflow
- Programming mode exit

To allow VDD to stabilize, an optional power-up timer can be enabled to extend the Reset time after a BOR or POR event.

A simplified block diagram of the On-Chip Reset Circuit is shown in Figure 5-1.

**FIGURE 5-1: SIMPLIFIED BLOCK DIAGRAM OF ON-CHIP RESET CIRCUIT**

## 5.3 Low-Power Brown-out Reset (LPBOR)

The Low-Power Brown-Out Reset (LPBOR) is an essential part of the Reset subsystem. Refer to Figure 5-1 to see how the BOR interacts with other modules.

The LPBOR is used to monitor the external VDD pin. When too low of a voltage is detected, the device is held in Reset. When this occurs, a register bit ( $\overline{\text{BOR}}$ ) is changed to indicate that a BOR Reset has occurred. The same bit is set for both the BOR and the LPBOR. Refer to Register 5-2.

### 5.3.1 ENABLING LPBOR

The LPBOR is controlled by the  $\overline{\text{LPBOR}}$  bit of Configuration Word 2. When the device is erased, the LPBOR module defaults to disabled.

#### 5.3.1.1 LPBOR Module Output

The output of the LPBOR module is a signal indicating whether or not a Reset is to be asserted. This signal is to be OR'd together with the Reset signal of the BOR module to provide the generic  $\overline{\text{BOR}}$  signal which goes to the PCON register and to the power control block.

## 5.4 $\overline{\text{MCLR}}$

The  $\overline{\text{MCLR}}$  is an optional external input that can reset the device. The MCLR function is controlled by the MCLRE bit of Configuration Word 1 and the LVP bit of Configuration Word 2 (Table 5-2).

**TABLE 5-2:  $\overline{\text{MCLR}}$  CONFIGURATION**

MCLRE	LVP	$\overline{\text{MCLR}}$
0	0	Disabled
1	0	Enabled
x	1	Enabled

### 5.4.1 $\overline{\text{MCLR}}$ ENABLED

When  $\overline{\text{MCLR}}$  is enabled and the pin is held low, the device is held in Reset. The  $\overline{\text{MCLR}}$  pin is connected to VDD through an internal weak pull-up.

The device has a noise filter in the  $\overline{\text{MCLR}}$  Reset path. The filter will detect and ignore small pulses.

**Note:** A Reset does not drive the  $\overline{\text{MCLR}}$  pin low.

### 5.4.2 $\overline{\text{MCLR}}$ DISABLED

When  $\overline{\text{MCLR}}$  is disabled, the pin functions as a general purpose input and the internal weak pull-up is under software control. See Section 11.4 “PORTE Registers” for more information.

## 5.5 Watchdog Timer (WDT) Reset

The Watchdog Timer generates a Reset if the firmware does not issue a  $\text{CLRWDT}$  instruction within the time-out period. The  $\overline{\text{TO}}$  and  $\overline{\text{PD}}$  bits in the STATUS register are changed to indicate the WDT Reset. See Section 9.0 “Watchdog Timer” for more information.

## 5.6 RESET Instruction

A  $\text{RESET}$  instruction will cause a device Reset. The  $\overline{\text{RI}}$  bit in the PCON register will be set to ‘0’. See Table 5-4 for default conditions after a  $\text{RESET}$  instruction has occurred.

## 5.7 Stack Overflow/Underflow Reset

The device can reset when the Stack Overflows or Underflows. The STKOVF or STKUNF bits of the PCON register indicate the Reset condition. These Resets are enabled by setting the STVREN bit in Configuration Word 2. See Section 5.7 “Stack Overflow/Underflow Reset” for more information.

## 5.8 Programming Mode Exit

Upon exit of Programming mode, the device will behave as if a POR had just occurred.

## 5.9 Power-Up Timer

The Power-up Timer optionally delays device execution after a BOR or POR event. This timer is typically used to allow VDD to stabilize before allowing the device to start running.

The Power-up Timer is controlled by the  $\overline{\text{PWRT}}$  bit of Configuration Word 1.

## 5.10 Start-up Sequence

Upon the release of a POR or BOR, the following must occur before the device will begin executing:

1. Power-up Timer runs to completion (if enabled).
2. Oscillator start-up timer runs to completion (if required for oscillator source).
3.  $\overline{\text{MCLR}}$  must be released (if enabled).

The total time-out will vary based on oscillator configuration and Power-up Timer configuration. See Section 6.0 “Oscillator Module” for more information.

The Power-up Timer and oscillator start-up timer run independently of  $\overline{\text{MCLR}}$  Reset. If  $\overline{\text{MCLR}}$  is kept low long enough, the Power-up Timer and oscillator start-up timer will expire. Upon bringing  $\overline{\text{MCLR}}$  high, the device will begin execution immediately (see Figure 5-3). This is useful for testing purposes or to synchronize more than one device operating in parallel.

## 6.2.2.2 LFINTOSC

The Low-Frequency Internal Oscillator (LFINTOSC) is an uncalibrated 31 kHz internal clock source.

The output of the LFINTOSC connects to a multiplexer (see Figure 6-1). Select 31 kHz, via software, using the IRCF<3:0> bits of the OSCCON register. See **Section 6.2.2.4 “Internal Oscillator Clock Switch Timing”** for more information. The LFINTOSC is also the frequency for the Power-up Timer (PWRT) and Watchdog Timer (WDT).

The LFINTOSC is enabled by selecting 31 kHz (IRCF<3:0> bits of the OSCCON register = 000) as the system clock source (SCS bits of the OSCCON register = 1x), or when any of the following are enabled:

- Configure the IRCF<3:0> bits of the OSCCON register for the desired LF frequency, and
- FOSC<1:0> = 01, or
- Set the System Clock Source (SCS) bits of the OSCCON register to '1x'

Peripherals that use the LFINTOSC are:

- Power-up Timer (PWRT)
- Watchdog Timer (WDT)

The Low-Frequency Internal Oscillator Ready bit (LFIOFR) of the OSCSTAT register indicates when the LFINTOSC is running and can be utilized.

## 6.2.2.3 Internal Oscillator Frequency Selection

The system clock speed can be selected via software using the Internal Oscillator Frequency Select bits IRCF<3:0> of the OSCCON register.

The output of the 16 MHz HFINTOSC and 31 kHz LFINTOSC connects to a postscaler and multiplexer (see Figure 6-1). The Internal Oscillator Frequency Select bits IRCF<3:0> of the OSCCON register select the frequency output of the internal oscillators. One of the following frequencies can be selected via software:

- 16 MHz
- 8 MHz
- 4 MHz
- 2 MHz
- 1 MHz
- 500 kHz (Default after Reset)
- 250 kHz
- 125 kHz
- 62.5 kHz
- 31.25 kHz
- 31 kHz (LFINTOSC)

**Note:** Following any Reset, the IRCF<3:0> bits of the OSCCON register are set to '0111' and the frequency selection is set to 500 kHz. The user can modify the IRCF bits to select a different frequency.

The IRCF<3:0> bits of the OSCCON register allow duplicate selections for some frequencies. These duplicate choices can offer system design trade-offs. Lower power consumption can be obtained when changing oscillator sources for a given frequency. Faster transition times can be obtained between frequency changes that use the same oscillator source.

## 6.2.2.4 Internal Oscillator Clock Switch Timing

When switching between the HFINTOSC and the LFINTOSC, the new oscillator may already be shut down to save power (see Figure 6-4). If this is the case, there is a delay after the IRCF<3:0> bits of the OSCCON register are modified before the frequency selection takes place. The OSCSTAT register will reflect the current active status of the HFINTOSC and LFINTOSC oscillators. The sequence of a frequency selection is as follows:

1. IRCF<3:0> bits of the OSCCON register are modified.
2. If the new clock is shut down, a clock start-up delay is started.
3. Clock switch circuitry waits for a falling edge of the current clock.
4. The current clock is held low and the clock switch circuitry waits for a rising edge in the new clock.
5. The new clock is now active.
6. The OSCSTAT register is updated as required.
7. Clock switch is complete.

See Figure 6-4 for more details.

If the internal oscillator speed is switched between two clocks of the same source, there is no start-up delay before the new frequency is selected. Clock switching time delays are shown in Table 6-2.

Start-up delay specifications are located in the oscillator tables of **Section 21.0 “Electrical Specifications”**

FIGURE 6-4: INTERNAL OSCILLATOR SWITCH TIMING

TABLE 6-1: OSCILLATOR SWITCHING DELAYS

Switch From	Switch To	Oscillator Delay
Any clock source	LFINTOSC	1 cycle of each clock source
	HFINTOSC	2 $\mu$ s (approx.)
	ECH, ECM, ECL	2 cycles
	Secondary Oscillator	1024 Secondary Oscillator Cycles

# PIC16LF1902/3

## 7.6 Interrupt Control Registers

### 7.6.1 INTCON REGISTER

The INTCON register is a readable and writable register, which contains the various enable and flag bits for TMR0 register overflow, interrupt-on-change and external INT pin interrupts.

**Note:** Interrupt flag bits are set when an interrupt condition occurs, regardless of the state of its corresponding enable bit or the Global Enable bit, GIE of the INTCON register. User software should ensure the appropriate interrupt flag bits are clear prior to enabling an interrupt.

#### REGISTER 7-1: INTCON: INTERRUPT CONTROL REGISTER

R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R-0/0
GIE	PEIE	TMR0IE	INTE	IOCIE	TMR0IF	INTF	IOCIF
bit 7							bit 0

#### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

u = Bit is unchanged

x = Bit is unknown

-n/n = Value at POR and BOR/Value at all other Resets

'1' = Bit is set

'0' = Bit is cleared

- bit 7      **GIE:** Global Interrupt Enable bit  
1 = Enables all active interrupts  
0 = Disables all interrupts
- bit 6      **PEIE:** Peripheral Interrupt Enable bit  
1 = Enables all active peripheral interrupts  
0 = Disables all peripheral interrupts
- bit 5      **TMR0IE:** Timer0 Overflow Interrupt Enable bit  
1 = Enables the Timer0 interrupt  
0 = Disables the Timer0 interrupt
- bit 4      **INTE:** INT External Interrupt Enable bit  
1 = Enables the INT external interrupt  
0 = Disables the INT external interrupt
- bit 3      **IOCIE:** Interrupt-on-Change Interrupt Enable bit  
1 = Enables the interrupt-on-change interrupt  
0 = Disables the interrupt-on-change interrupt
- bit 2      **TMR0IF:** Timer0 Overflow Interrupt Flag bit  
1 = TMR0 register has overflowed  
0 = TMR0 register did not overflow
- bit 1      **INTF:** INT External Interrupt Flag bit  
1 = The INT external interrupt occurred  
0 = The INT external interrupt did not occur
- bit 0      **IOCIF:** Interrupt-on-Change Interrupt Flag bit  
1 = When at least one of the interrupt-on-change pins changed state  
0 = None of the interrupt-on-change pins have changed state

## EXAMPLE 10-2: ERASING ONE ROW OF PROGRAM MEMORY

```

; This row erase routine assumes the following:
; 1. A valid address within the erase row is loaded in ADDRH:ADDRL
; 2. ADDRH and ADDRL are located in shared data memory 0x70 - 0x7F (common RAM)

      BCF      INTCON,GIE      ; Disable ints so required sequences will execute properly
      BANKSEL  PMADRL
      MOVF     ADDRL,W         ; Load lower 8 bits of erase address boundary
      MOVWF    PMADRL
      MOVF     ADDRH,W         ; Load upper 6 bits of erase address boundary
      MOVWF    PMADRH
      BCF      PMCON1,CFGSR    ; Not configuration space
      BSF      PMCON1,FREER    ; Specify an erase operation
      BSF      PMCON1,WREN      ; Enable writes

      MOVLW    55h             ; Start of required sequence to initiate erase
      MOVWF    PMCON2          ; Write 55h
      MOVLW    0AAh           ;
      MOVWF    PMCON2          ; Write AAh
      BSF      PMCON1,WR       ; Set WR bit to begin erase
      NOP      ; NOP instructions are forced as processor starts
      NOP      ; row erase of program memory.
      ;
      ; The processor stalls until the erase process is complete
      ; after erase processor continues with 3rd instruction

      BCF      PMCON1,WREN      ; Disable writes
      BSF      INTCON,GIE      ; Enable interrupts

```

Required  
Sequence

## 16.2 Option and Timer0 Control Register

**REGISTER 16-1: OPTION\_REG: OPTION REGISTER**

R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1

# PIC16LF1902/3

**TABLE 18-1: LCD SEGMENT AND DATA REGISTERS**

Device	# of LCD Registers	
	Segment Enable	Data
PIC16LF1902/3	3	12

The LCDCON register (Register 18-1) controls the operation of the LCD Driver module. The LCDPS register (Register 18-2) configures the LCD clock source prescaler and the type of waveform; Type-A or Type-B. The LCDSEn registers (Register 18-5) configure the functions of the port pins.

The following LCDSEn registers are available:

- LCDSE0 SE<7:0>
- LCDSE1 SE<15:8>
- LCDSE3 SE<26:24>

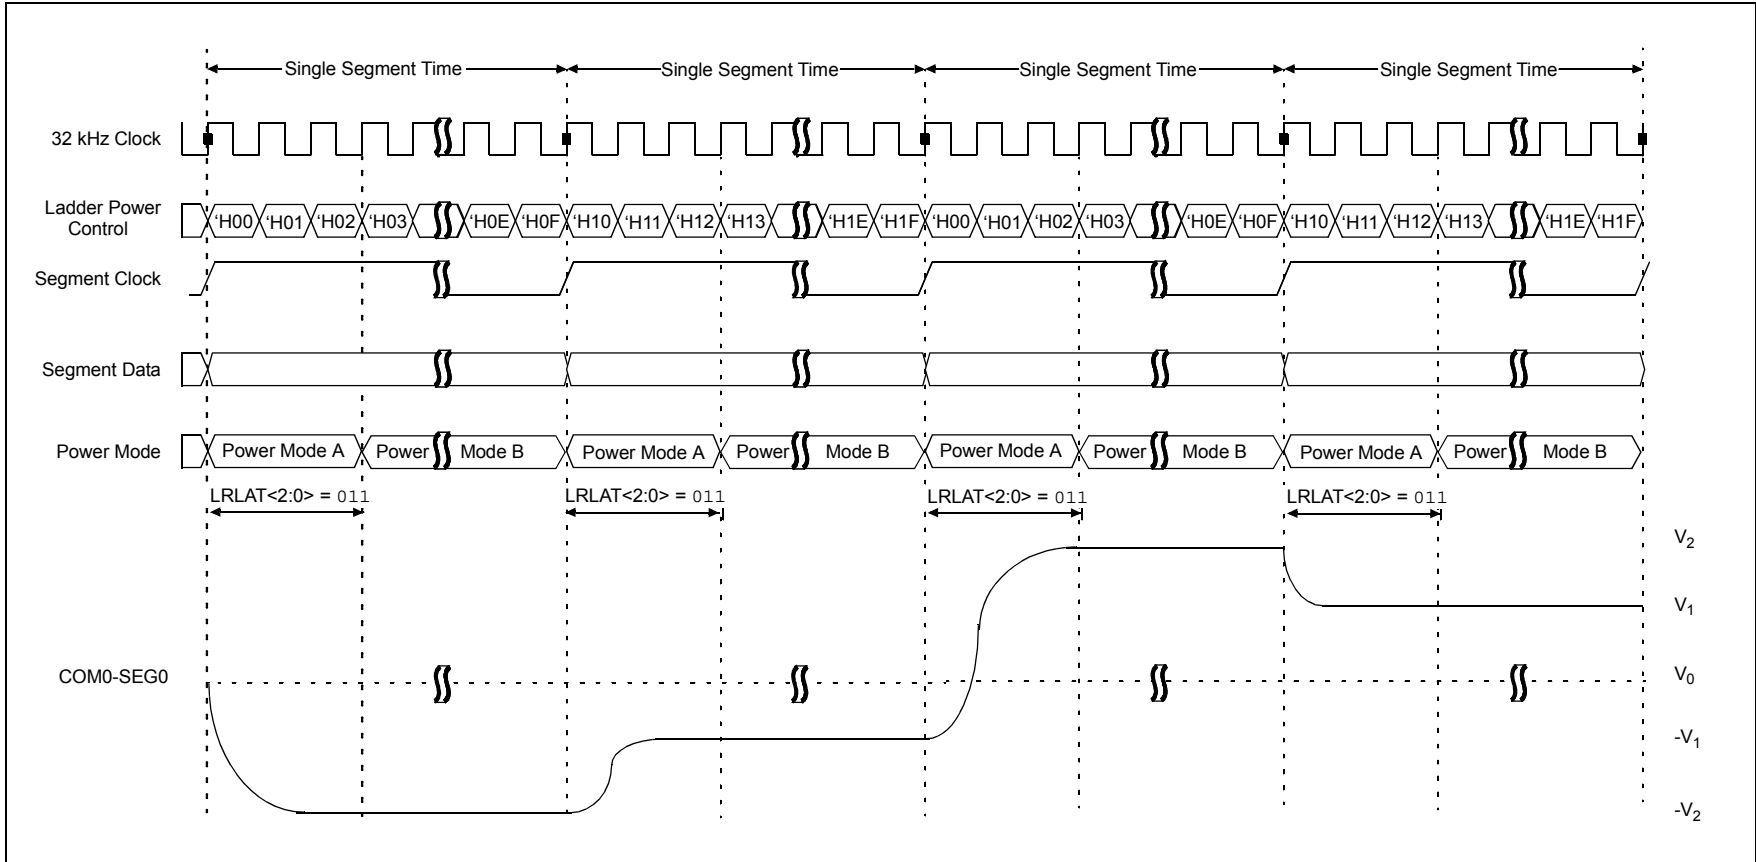

Once the module is initialized for the LCD panel, the individual bits of the LCDDATAN registers are cleared/set to represent a clear/dark pixel, respectively:

- LCDDATA0 SEG<7:0>COM0
- LCDDATA1 SEG<15:8>COM0
- LCDDATA3 SEG<7:0>COM1
- LCDDATA4 SEG<15:8>COM1
- LCDDATA6 SEG<7:0>COM2
- LCDDATA7 SEG<15:8>COM2
- LCDDATA9 SEG<7:0>COM3
- LCDDATA10 SEG<15:8>COM3
- LCDDATA12 SEG<26:24>COM0
- LCDDATA15 SEG<26:24>COM1
- LCDDATA18 SEG<26:24>COM2
- LCDDATA21 SEG<26:24>COM3

As an example, LCDDATAN is detailed in Register 18-6.

Once the module is configured, the LCDEN bit of the LCDCON register is used to enable or disable the LCD module. The LCD panel can also operate during Sleep by clearing the SLPEN bit of the LCDCON register.

x = Bit is unknown

-n/n = Value at POR and BOR/Value at all other Resets

'1' = Bit is set

'0' = Bit is cleared

bit 7-6 **LRLAP<1:0>**: LCD Reference Ladder A Time Power Control bits

During Time interval A (Refer to Figure 18-4):

00 = Internal LCD Reference Ladder is powered down and unconnected

01 = Internal LCD Reference Ladder is powered in Low-Power mode

10 = Internal LCD Reference Ladder is powered in Medium-Power mode

11 = Internal LCD Reference Ladder is powered in High-Power mode

bit 5-4 **LRLBP<1:0>**: LCD Reference Ladder B Time Power Control bits

During Time interval B (Refer to Figure 18-4):

00 = Internal LCD Reference Ladder is powered down and unconnected

01 = Internal LCD Reference Ladder is powered in Low-Power mode

10 = Internal LCD Reference Ladder is powered in Medium-Power mode

11 = Internal LCD Reference Ladder is powered in High-Power mode

bit 3 **Unimplemented**: Read as '0'

bit 2-0 **LRLAT<2:0>**: LCD Reference Ladder A Time Interval Control bits

Sets the number of 32 kHz clocks that the A Time Interval Power mode is active

For type A waveforms (WFT = 0):

000 = Internal LCD Reference Ladder is always in 'B' Power mode

001 = Internal LCD Reference Ladder is in 'A' Power mode for 1 clock and 'B' Power mode for 15 clocks

010 = Internal LCD Reference Ladder is in 'A' Power mode for 2 clocks and 'B' Power mode for 14 clocks

011 = Internal LCD Reference Ladder is in 'A' Power mode for 3 clocks and 'B' Power mode for 13 clocks

100 = Internal LCD Reference Ladder is in 'A' Power mode for 4 clocks and 'B' Power mode for 12 clocks

101 = Internal LCD Reference Ladder is in 'A' Power mode for 5 clocks and 'B' Power mode for 11 clocks

110 = Internal LCD Reference Ladder is in 'A' Power mode for 6 clocks and 'B' Power mode for 10 clocks

111 = Internal LCD Reference Ladder is in 'A' Power mode for 7 clocks and 'B' Power mode for 9 clocks

For type B waveforms (WFT = 1):

000 = Internal LCD Reference Ladder is always in 'B' Power mode.

001 = Internal LCD Reference Ladder is in 'A' Power mode for 1 clock and 'B' Power mode for 31 clocks

010 = Internal LCD Reference Ladder is in 'A' Power mode for 2 clocks and 'B' Power mode for 30 clocks

011 = Internal LCD Reference Ladder is in 'A' Power mode for 3 clocks and 'B' Power mode for 29 clocks

100 = Internal LCD Reference Ladder is in 'A' Power mode for 4 clocks and 'B' Power mode for 28 clocks

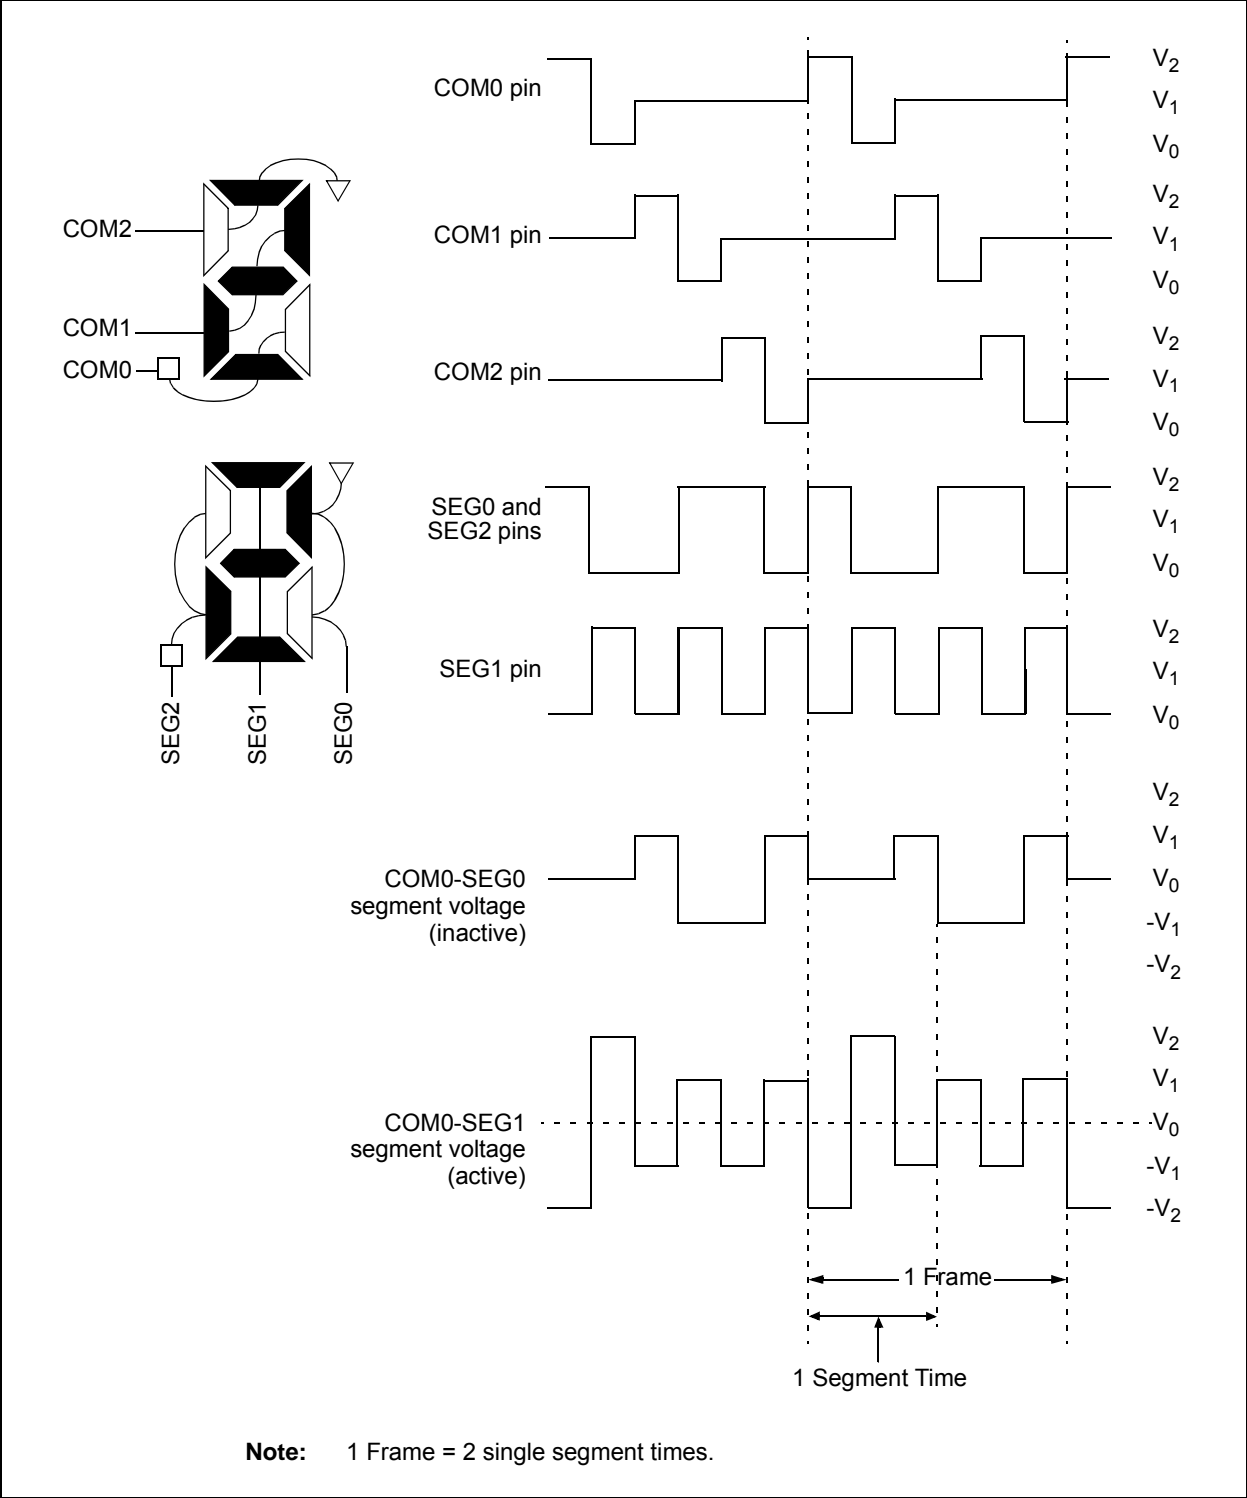

101 = Internal LCD Reference Ladder is in 'A' Power mode for 5 clocks and 'B' Power mode for 27 clocks

110 = Internal LCD Reference Ladder is in 'A' Power mode for 6 clocks and 'B' Power mode for 26 clocks

111 = Internal LCD Reference Ladder is in 'A' Power mode for 7 clocks and 'B' Power mode for 25 clocks

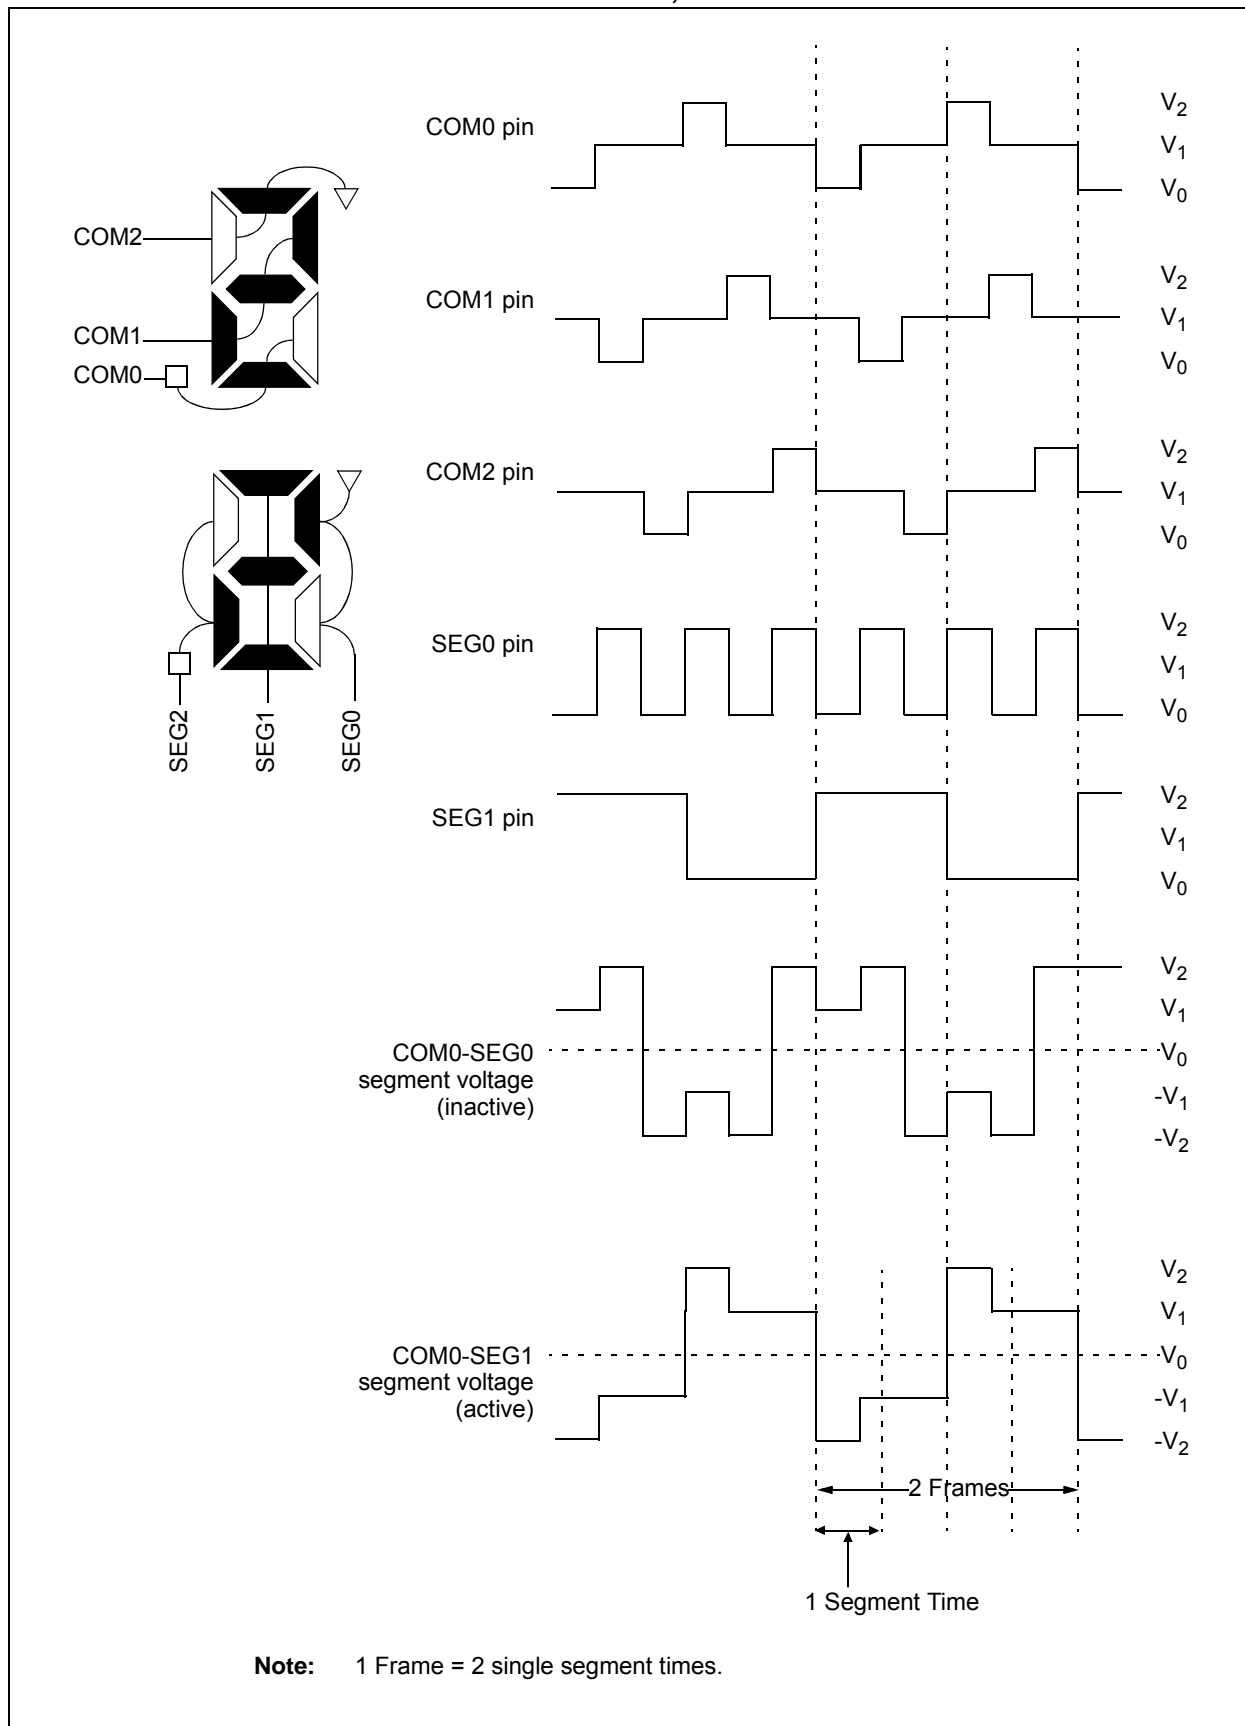

# PIC16LF1902/3

FIGURE 18-13: TYPE-A WAVEFORMS IN 1/3 MUX, 1/2 BIAS DRIVE

**FIGURE 18-14: TYPE-B WAVEFORMS IN 1/3 MUX, 1/2 BIAS DRIVE**

## MOVWI Move W to INDFn

**Syntax:** [ *label* ] MOVWI ++FSRn  
[ *label* ] MOVWI --FSRn  
[ *label* ] MOVWI FSRn++  
[ *label* ] MOVWI FSRn--  
[ *label* ] MOVWI k[FSRn]

**Operands:** n ∈ [0,1]  
mm ∈ [00,01, 10, 11]  
-32 ≤ k ≤ 31

**Operation:** W → INDFn  
Effective address is determined by

- FSR + 1 (preincrement)
- FSR - 1 (predecrement)
- FSR + k (relative offset)

After the Move, the FSR value will be either:

- FSR + 1 (all increments)
- FSR - 1 (all decrements)

Unchanged

**Status Affected:** None

Mode	Syntax	mm
Preincrement	++FSRn	00
Predecrement	--FSRn	01
Postincrement	FSRn++	10
Postdecrement	FSRn--	11

**Description:** This instruction is used to move data between W and one of the indirect registers (INDFn). Before/after this move, the pointer (FSRn) is updated by pre/post incrementing/decrementing it.

**Note:** The INDFn registers are not physical registers. Any instruction that accesses an INDFn register actually accesses the register at the address specified by the FSRn.

FSRn is limited to the range 0000h - FFFFh. Incrementing/decrementing it beyond these bounds will cause it to wrap-around.

The increment/decrement operation on FSRn WILL NOT affect any Status bits.

## NOP No Operation

**Syntax:** [ *label* ] NOP

**Operands:** None

**Operation:** No operation

**Status Affected:** None

**Description:** No operation.

**Words:** 1

**Cycles:** 1

**Example:** NOP

## OPTION Load OPTION\_REG Register with W

**Syntax:** [ *label* ] OPTION

**Operands:** None

**Operation:** (W) → OPTION\_REG

**Status Affected:** None

**Description:** Move data from W register to OPTION\_REG register.

**Words:** 1

**Cycles:** 1

**Example:** OPTION

Before Instruction  
OPTION\_REG = 0xFF  
W = 0x4F

After Instruction  
OPTION\_REG = 0x4F  
W = 0x4F

## RESET Software Reset

**Syntax:** [ *label* ] RESET

**Operands:** None

**Operation:** Execute a device Reset. Resets the nRI flag of the PCON register.

**Status Affected:** None

**Description:** This instruction provides a way to execute a hardware Reset by software.

## 23.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

## 23.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

## 23.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

## 23.9 PICkit 3 In-Circuit Debugger/Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

## 23.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

## 28-Lead Plastic Shrink Small Outline (SS) - 5.30 mm Body [SSOP]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E	0.65 BSC		
Contact Pad Spacing	C		7.20	
Contact Pad Width (X28)	X1			0.45
Contact Pad Length (X28)	Y1			1.75
Distance Between Pads	G	0.20		

**Notes:**

1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.
