What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

4.1.1 BOOT FLASH SEQUENCE AND CONFIGURATION SPACES

Sequence space is used to identify which boot Flash is aliased by aliased regions. If the value programmed into the TSEQ<15:0> bits of the BF1SEQ0 word is equal to or greater than the value programmed into the TSEQ<15:0> bits of the BF2SEQ0 word, Boot Flash 1 is aliased by the lower boot alias region, and Boot Flash 2 is aliased by the upper boot alias region. If TSEQ<15:0> bits of BF2SEQ0 is greater than TSEQ<15:0> bits of BF1SEQ0, the opposite is true (see Table 4-2 and Table 4-3 for BFxSEQ0 word memory locations).

The CSEQ<15:0> bits must contain the complement value of the TSEQ<15:0> bits; otherwise, the value of TSEQ<15:0> is considered invalid, and an alternate sequence is used. See **Section 4.1.2 "Alternate Sequence and Configuration Words"** for more information.

Once boot Flash memories are aliased, configuration space located in the lower boot alias region is used as the basis for the Configuration words, DEVSIGN0, DEVCP0, and DEVCFGx (and the associated alternate configuration registers). This means that the boot Flash region to be aliased by lower boot alias region memory must contain configuration values in the appropriate memory locations.

Note:	Do not use word program operation (NVMOP<3:0> = `0001`) when programming data into the sequence and configuration spaces.

4.1.2 ALTERNATE SEQUENCE AND CONFIGURATION WORDS

Every word in the configuration space and sequence space has an associated alternate word (designated by the letter A as the first letter in the name of the word). During device start-up, primary words are read and if uncorrectable ECC errors are found, the BCFGERR (RCON<27>) flag is set and alternate words are used. If uncorrectable ECC errors are found in primary and alternate words, the BCFGFAIL (RCON<26>) flag is set and the default configuration is used.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
