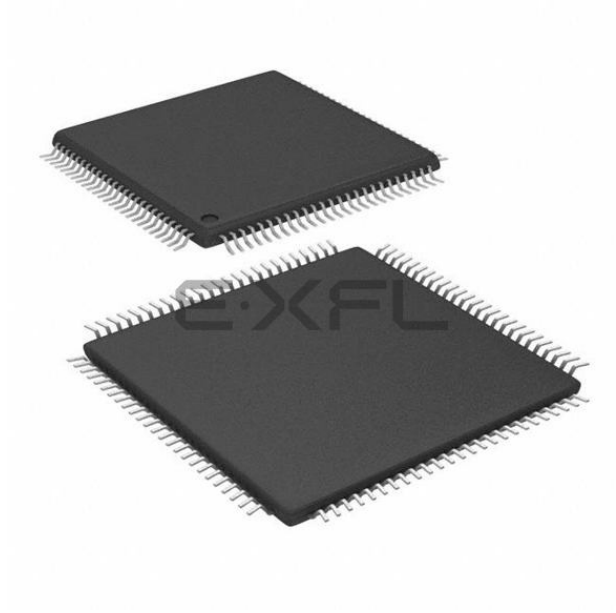
Microchip Technology - PIC32MZ2048ECH100T-I/PT Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® microAptiv™
Core Size	32-Bit Single-Core
Speed	200MHz
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	78
Program Memory Size	2MB (2M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 40x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mz2048ech100t-i-pt

3.7 microAptiv™ Core Configuration

Register 3-1 through Register 3-4 show the default configuration of the microAptiv core, which is included on PIC32MZ EC family devices.

REGISTER 3-1: CONFIG: CONFIGURATION REGISTER; CP0 REGISTER 16, SELECT 0

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	r-1	U-0	U-0	U-0	U-0	U-0	U-0	R-0
	—	—	—	—	—	—	—	ISP
23:16	R-0	R-0	R-1	R-0	U-0	R-1	R-0	R-0
	DSP	UDI	SB	MDU	—	MM<1:0>		BM
15:8	R-0	R-0	R-0	R-0	R-0	R-1	R-0	R-0
	BE	AT<1:0>		AR<2:0>			MT<2:1>	
7:0	R-1	U-0	U-0	U-0	U-0	R/W-0	R/W-1	R/W-0
	MT<0>	—	—	—	—	K0<2:0>		

Legend:	r = Reserved bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **Reserved:** This bit is hardwired to '1' to indicate the presence of the Config1 register.

bit 30-25 **Unimplemented:** Read as '0'

bit 24 **ISP:** Instruction Scratch Pad RAM bit
0 = Instruction Scratch Pad RAM is not implemented

bit 23 **DSP:** Data Scratch Pad RAM bit
0 = Data Scratch Pad RAM is not implemented

bit 22 **UDI:** User-defined bit
0 = CorExtend User-Defined Instructions are not implemented

bit 21 **SB:** SimpleBE bit
1 = Only Simple Byte Enables are allowed on the internal bus interface

bit 20 **MDU:** Multiply/Divide Unit bit
0 = Fast, high-performance MDU

bit 19 **Unimplemented:** Read as '0'

bit 18-17 **MM<1:0>:** Merge Mode bits
10 = Merging is allowed

bit 16 **BM:** Burst Mode bit
0 = Burst order is sequential

bit 15 **BE:** Endian Mode bit
0 = Little-endian

bit 14-13 **AT<1:0>:** Architecture Type bits
00 = MIPS32

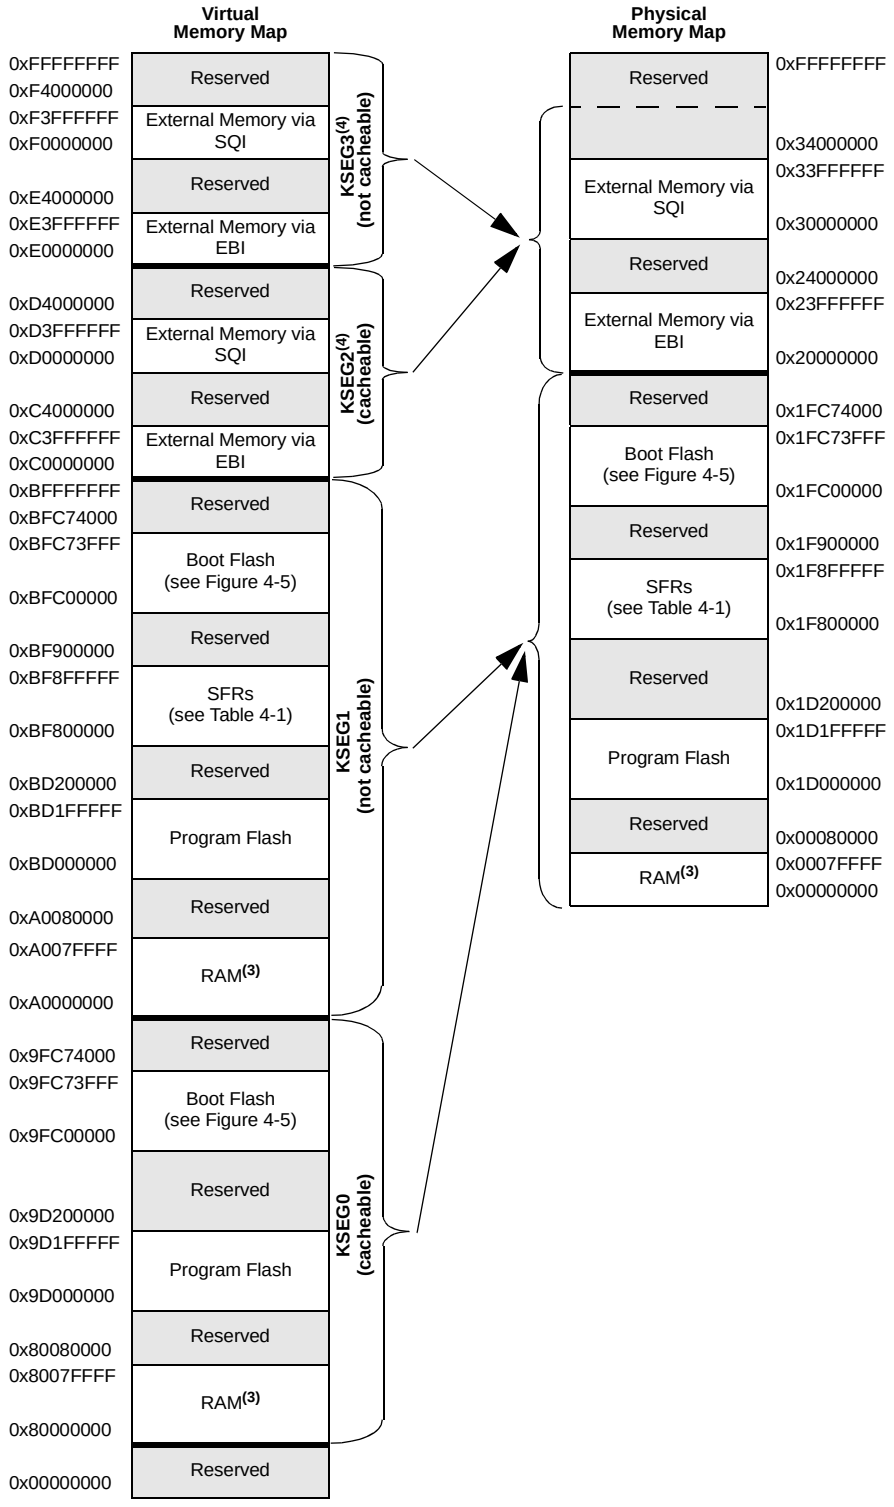
bit 12-10 **AR<2:0>:** Architecture Revision Level bits
001 = MIPS32 Release 2

bit 9-7 **MT<2:0>:** MMU Type bits
001 = microAptiv MPU Microprocessor core uses a TLB-based MMU

bit 6-3 **Unimplemented:** Read as '0'

bit 2-0 **K0<2:0>:** Kseg0 Coherency Algorithm bits
011 = Cacheable, non-coherent, write-back, write allocate
010 = Uncached
001 = Cacheable, non-coherent, write-through, write allocate
000 = Cacheable, non-coherent, write-through, no write allocate
All other values are not used and are mapped to other values. Values 100, 101, and 110 are mapped to 010. Value 111 is mapped to 010.

FIGURE 4-4: MEMORY MAP FOR DEVICES WITH 2048 KB OF PROGRAM MEMORY(1,2)



Note 1: Memory areas are not shown to scale.

2: The Cache, MMU, and TLB are initialized by compiler start-up code.

3: RAM memory is divided into two equal banks: RAM Bank 1 and RAM Bank 2 on a half boundary.

4: The MMU must be enabled and the TLB must be set up to access this segment.

REGISTER 4-2: SBFLAG: SYSTEM BUS STATUS FLAG REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.2 "CLR, SET, and INV Registers"** for more information.
2: This bit or register is not available on 64-pin devices.
3: This bit or register is not available on devices without a CAN module.
4: This bit or register is not available on 100-pin devices.
5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
7: This bit or register is not available on devices without a Crypto module.
8: This bit or register is not available on 124-pin devices.

REGISTER 10-7: DCHxCON: DMA CHANNEL x CONTROL REGISTER (CONTINUED)

bit 4 **CHAEN:** Channel Automatic Enable bit
1 = Channel is continuously enabled, and not automatically disabled after a block transfer is complete
0 = Channel is disabled on block transfer complete

bit 3 **Unimplemented:** Read as '0'

bit 2 **CHEDET:** Channel Event Detected bit
1 = An event has been detected
0 = No events have been detected

bit 1-0 **CHPRI<1:0>:** Channel Priority bits
11 = Channel has priority 3 (highest)
10 = Channel has priority 2
01 = Channel has priority 1
00 = Channel has priority 0

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

REGISTER 10-9: DCHxINT: DMA CHANNEL x INTERRUPT CONTROL REGISTER

0 = Interrupt is disabled

bit 16 **CHERIE:** Channel Address Error Interrupt Enable bit
1 = Interrupt is enabled
0 = Interrupt is disabled

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **CHSDIF:** Channel Source Done Interrupt Flag bit
1 = Channel Source Pointer has reached end of source (CHSPTR = CHSSIZ)
0 = No interrupt is pending

bit 6 **CHSHIF:** Channel Source Half Empty Interrupt Flag bit
1 = Channel Source Pointer has reached midpoint of source (CHSPTR = CHSSIZ/2)
0 = No interrupt is pending

12.1 Parallel I/O (PIO) Ports

All port pins have ten registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

12.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx, and TRISx registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V-tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

Refer to the pin name tables (Table 2 through Table 5) for the available pins and their functionality.

12.1.2 CONFIGURING ANALOG AND DIGITAL PORT PINS

The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs must have their corresponding ANSEL and TRIS bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

If the TRIS bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or Comparator module.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

12.1.3 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP.

12.1.4 INPUT CHANGE NOTIFICATION

The input change notification function of the I/O ports allows the PIC32MZ EC devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-of-states even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a change-of-state.

Five control registers are associated with the CN functionality of each I/O port. The CNENx registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

The CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups act as a current source or sink source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups and pull-downs are enabled separately using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

Note:	Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output.

An additional control register (CNCONx) is shown in Register 12-3.

12.2 CLR, SET, and INV Registers

Every I/O module register has a corresponding CLR (clear), SET (set) and INV (invert) register designed to provide fast atomic bit manipulations. As the name of the register implies, a value written to a SET, CLR or INV register effectively performs the implied operation, but only on the corresponding base register and only bits specified as '1' are modified. Bits specified as '0' are not modified.

Reading SET, CLR and INV registers returns undefined values. To see the affects of a write operation to a SET, CLR or INV register, the base register must be read.

TABLE 12-11: PORTE REGISTER MAP FOR 64-PIN DEVICES ONLY

Virtual Address (BF86_#)	Register Name(1)	Bit Range	Bits																All Resets
			31/15	30/14	29/13	28/12	27/11	26/10	25/9	24/8	23/7	22/6	21/5	20/4	19/3	18/2	17/1	16/0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-13 **Unimplemented:** Read as '0'

bit 12 **LOAD:** Device Select bit

This bit is self-clearing and is used to load the seed from the TRNG (i.e., the random value) as a seed to the PRNG.

bit 11 **Unimplemented:** Read as '0'

bit 10 **CONT:** PRNG Number Shift Enable bit

1 = The PRNG random number is shifted every cycle
0 = The PRNG random number is shifted when the previous value is removed

bit 9 **PRNGEN:** PRNG Operation Enable bit

1 = PRNG operation is enabled
0 = PRNG operation is not enabled

bit 8 **TRNGEN:** TRNG Operation Enable bit

1 = TRNG operation is enabled
0 = TRNG operation is not enabled

bit 7-0 **PLEN<7:0>:** PRNG Polynomial Length bits

These bits contain the length of the polynomial used for the PRNG.

Microchip Technology Drawing C04-085C Sheet 1 of 2

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ Feature
Fail-Safe Clock Monitor (FSCM)	
On PIC32MX devices, the internal FRC became the clock source on a failure of the clock source.	On PIC32MZ devices, a separate internal Backup FRC (BFRC) becomes the clock source upon a failure at the clock source.
On PIC32MX devices, a clock failure resulted in the triggering of a specific interrupt when the switchover was complete. **FSCM generates an interrupt.**	On PIC32MZ devices, a NMI is triggered instead, and must be handled by the NMI routine. **FSCM generates a NMI.**
FCKSM<1:0> (DEVCFG1<15:14>) **1x = Clock switching is disabled, FSCM is disabled** 01 = Clock switching is enabled, FSCM is disabled **00 = Clock switching is enabled, FSCM is enabled**	The definitions of the FCKSM<1:0> bits has changed on PIC32MZ devices. FCKSM<1:0> (DEVCFG1<15:14>) **11 = Clock switching is enabled and clock monitoring is enabled** **10 = Clock switching is disabled and clock monitoring is enabled** 01 = Clock switching is enabled and clock monitoring is disabled **00 = Clock switching is disabled and clock monitoring is disabled**
On PIC32MX devices, the CF (OSCCON<3>) bit indicates a clock failure. Writing to this bit initiates a FSCM event.	On PIC32MZ devices, the CF (OSCCON<3>) bit has the same functionality as that of PIC32MX device; however, an additional CF(RNMICON<1>) bit is available to indicate a NMI event. Writing to this bit causes a NMI event, but not a FSCM event.
On PIC32MX devices, the CLKLOCK (OSCCON<7>) bit is controlled by the FSCM. CLKLOCK (OSCCON<7>) **If clock switching and monitoring is disabled (FCKSM<1:0> = 1x):** 1 = Clock and PLL selections are locked 0 = Clock and PLL selections are not locked and may be modified **If clock switching and monitoring is enabled (FCKSM<1:0> = 0x):** **Clock and PLL selections are never locked and may be modified.**	On PIC32MZ devices, the CLKLOCK (OSCCON<7>) bit is not impacted by the FSCM. CLKLOCK (OSCCON<7>) 1 = Clock and PLL selections are locked 0 = Clock and PLL selections are not locked and may be modified

Table A-2 illustrates the difference in code setup of the respective parts for maximum speed using an external 24 MHz crystal.

A.3 CPU

The CPU in the PIC32MZ family of devices has been changed to the MIPS microAptiv™ MPU architecture. This CPU includes DSP ASE, internal data and instruction L1 caches, and a TLB-based MMU.

Table A-4 summarizes some of the key differences (indicated by **Bold** type) in the internal CPU registers.

TABLE A-4: CPU DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ Feature
L1 Data and Instruction Cache and Prefetch Wait States	
On PIC32MX devices, the cache was included in the prefetch module outside the CPU. PREFEN<1:0> (**CHECON**<5:4>) **11 = Enable predictive prefetch for both cacheable and non-cacheable regions** **10 = Enable predictive prefetch for non-cacheable regions only** **01 = Enable predictive prefetch for cacheable regions only** 00 = Disable predictive prefetch DCSZ<1:0> (CHECON<9:8>) Changing these bits causes all lines to be reinitialized to the "invalid" state. 11 = Enable data caching with a size of 4 lines 10 = Enable data caching with a size of 2 lines 01 = Enable data caching with a size of 1 line 00 = Disable data caching CHECOH (CHECON<16>) 1 = Invalidate all data and instruction lines 0 = Invalidate all data and instruction lines that are not locked	On PIC32MZ devices, the CPU has a separate L1 instruction and data cache in the core. The PREFEN<1:0> bits still enable the prefetch module; however, the K0<2:0> bits in the CP0 registers controls the internal L1 cache for the designated regions. PREFEN<1:0> (**PRECON**<5:4>) **11 = Enable predictive prefetch for any address** **10 = Enable predictive prefetch for CPU instructions and CPU data** **01 = Enable predictive prefetch for CPU instructions only** 00 = Disable predictive prefetch **K0<2:0> (CP0 Reg 16, Select 0)** **011 = Cacheable, non-coherent, write-back, write allocate** **010 = Uncached** **001 = Cacheable, non-coherent, write-through, write allocate** **000 = Cacheable, non-coherent, write-through, no write allocate**
	The Program Flash Memory read wait state frequency points have changed in PIC32MZ devices. The register for accessing the PFMWS field has changed from CHECON to PRECON. PFMWS<2:0> (**PRECON**<2:0>) 111 = Seven Wait states • • • 011 = Three Wait states 010 = Two Wait states **(133-200 MHz)** 001 = One Wait state **(66-133 MHz)** 000 = Zero Wait states **(0-66 MHz)** **Note:** Wait states listed are for ECC enabled.
PFMWS<2:0> (**CHECON**<2:0>) 111 = Seven Wait states 110 = Six Wait states 101 = Five Wait states 100 = Four Wait states 011 = Three Wait states 010 = Two Wait states **(61-80 MHz)** 001 = One Wait state **(31-60 MHz)** 000 = Zero Wait state **(0-30 MHz)**
