Microchip Technology - PIC32MZ2048ECH144T-I/PL Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® microAptiv™
Core Size	32-Bit Single-Core
Speed	200MHz
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	120
Program Memory Size	2MB (2M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 48x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	144-LQFP
Supplier Device Package	144-LQFP (20x20)

3.2 Architecture Overview

The MIPS32 microAptiv Microprocessor core in PIC32MZ EC family devices contains several logic blocks working together in parallel, providing an efficient high-performance computing engine. The following blocks are included with the core:

- Execution unit
- General Purpose Register (GPR)
- Multiply/Divide Unit (MDU)
- System control coprocessor (CP0)
- Memory Management Unit (MMU)
- Instruction/Data cache controllers
- Power Management
- Instructions and data caches
- microMIPS support
- Enhanced JTAG (EJTAG) controller

3.2.1 EXECUTION UNIT

The processor core execution unit implements a load/store architecture with single-cycle ALU operations (logical, shift, add, subtract) and an autonomous multiply/divide unit. The core contains thirty-two 32-bit General Purpose Registers (GPRs) used for integer operations and address calculation. Seven additional register file shadow sets (containing thirty-two registers) are added to minimize context switching overhead during interrupt/exception processing. The register file consists of two read ports and one write port and is fully bypassed to minimize operation latency in the pipeline.

The execution unit includes:

- 32-bit adder used for calculating the data address
- Address unit for calculating the next instruction address
- Logic for branch determination and branch target address calculation
- Load aligner
- Bypass multiplexers used to avoid stalls when executing instruction streams where data producing instructions are followed closely by consumers of their results
- Leading Zero/One detect unit for implementing the `CLZ` and `CLO` instructions
- Arithmetic Logic Unit (ALU) for performing arithmetic and bitwise logical operations
- Shifter and store aligner
- DSP ALU and logic block for performing DSP instructions, such as arithmetic/shift/compare operations

3.2.2 MULTIPLY/DIVIDE UNIT (MDU)

The processor core includes a Multiply/Divide Unit (MDU) that contains a separate pipeline for multiply and divide operations, and DSP ASE multiply instructions. This pipeline operates in parallel with the Integer Unit (IU) pipeline and does not stall when the IU pipeline stalls. This allows MDU operations to be partially masked by system stalls and/or other integer unit instructions.

The high-performance MDU consists of a 32x32 booth recoded multiplier, four pairs of result/accumulation registers (HI and LO), a divide state machine, and the necessary multiplexers and control logic. The first number shown ('32' of 32x32) represents the *rs* operand. The second number ('32' of 32x32) represents the *rt* operand.

The MDU supports execution of one multiply or multiply-accumulate operation every clock cycle.

Divide operations are implemented with a simple 1-bit-per-clock iterative algorithm. An early-in detection checks the sign extension of the dividend (*rs*) operand. If *rs* is 8 bits wide, 23 iterations are skipped. For a 16-bit wide *rs*, 15 iterations are skipped and for a 24-bit wide *rs*, 7 iterations are skipped. Any attempt to issue a subsequent `MDU` instruction while a divide is still active causes an IU pipeline stall until the divide operation has completed.

Table 3-1 lists the repeat rate (peak issue rate of cycles until the operation can be reissued) and latency (number of cycles until a result is available) for the processor core multiply and divide instructions. The approximate latency and repeat rates are listed in terms of pipeline clocks.

TABLE 3-1: MIPS32 microAptiv MICROPROCESSOR CORE HIGH-PERFORMANCE INTEGER MULTIPLY/DIVIDE UNIT LATENCIES AND REPEAT RATES

REGISTER 8-1: OSCCON: OSCILLATOR CONTROL REGISTER

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits

111 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)
110 = Reserved
101 = Internal Low-Power RC (LPRC) Oscillator
100 = Secondary Oscillator (SOSC)
011 = Reserved
010 = Primary Oscillator (POSC) (HS or EC)
001 = System PLL (SPLL)
000 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

On Reset, these bits are set to the value of the FNOSC<2:0> Configuration bits (DEVCFG1<2:0>).

bit 7 **CLKLOCK:** Clock Selection Lock Enable bit

1 = Clock and PLL selections are locked
0 = Clock and PLL selections are not locked and may be modified

bit 6 **ULOCK:** USB PLL Lock Status bit

1 = Indicates that the USB PLL module is in lock or USB PLL module start-up timer is satisfied
0 = Indicates that the USB PLL module is out of lock or USB PLL module start-up timer is in progress or USB PLL is disabled

bit 5 **SLOCK:** System PLL Lock Status bit

1 = System PLL module is in lock or module start-up timer is satisfied
0 = System PLL module is out of lock, start-up timer is running or system PLL is disabled

bit 4 **SLPEN:** Sleep Mode Enable bit

1 = Device will enter Sleep mode when a WAIT instruction is executed
0 = Device will enter Idle mode when a WAIT instruction is executed

bit 3 **CF:** Clock Fail Detect bit

1 = FSCM has detected a clock failure
0 = No clock failure has been detected

bit 2 **Unimplemented:** Read as '0'

bit 1 **SOSCEN:** Secondary Oscillator (SOSC) Enable bit

1 = Enable Secondary Oscillator
0 = Disable Secondary Oscillator

bit 0 **OSWEN:** Oscillator Switch Enable bit**(1)**

1 = Initiate an oscillator switch to selection specified by NOSC<2:0> bits
0 = Oscillator switch is complete

Note 1: The reset value for this bit depends on the setting of the IESO (DEVCFG1<7>) bit. When IESO = 1, the reset value is '1'. When IESO = 0, the reset value is '0'.

Note:	Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

16.0 WATCHDOG TIMER (WDT)

Note: This data sheet summarizes the features of the PIC32MZ Embedded Connectivity (EC) Family family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. "Watchdog, Deadman, and Power-up Timers"** (DS60001114), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

When enabled, the Watchdog Timer (WDT) operates from the internal Low-Power Oscillator (LPRC) clock source and can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode.

Some of the key features of the WDT module are:

- Configuration or software controlled
- User-configurable time-out period
- Can wake the device from Sleep or Idle

Note 1: This bit can only be written when the ON bit = 0. Refer to **Section 37.0 "Electrical Characteristics"** for maximum clock frequency requirements.

2: This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

3: When AUDEN = 1, the SPI/I^2S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

4: This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.3 "Peripheral Pin Select (PPS)"** for more information).

The counter decrements on any alarm event. The counter only rolls over from 0x00 to 0xFF if CHIME = 1.

Note 1: Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.

2: This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

Note:	This register is reset only on a Power-on Reset (POR).

bit 31 **CAL:** Calibration bit(2)
1 = Initiate an ADC calibration cycle
0 = Calibration cycle is not in progress

bit 30 **GSWTRG:** Global Software Trigger bit
1 = Trigger analog-to-digital conversion for ADC inputs that have selected the GSWTRG bit as the trigger signal, either through the associated TRGSRC<4:0> bits in the AD1TRGn registers or through the STRGSRC<4:0> bits in the AD1CON1 register
0 = This bit is automatically cleared

bit 29 **RQCNVRT:** Individual ADC Input Conversion Request bit
This bit and its associated ADINSEL<5:0> bits enable the user to individually request an analog-to-digital conversion of an analog input without having to reprogram the TRGSRC<4:0> bits or the STRGSRC<4:0> bits. This is very useful during debugging or error handling situations where the user software needs to obtain an immediate ADC result of a specific input.
1 = Trigger the conversion of the selected ADC input as specified by the ADINSEL<5:0> bits
0 = This bit is automatically cleared

PAUSE Timer Value used for Flow Control.
This register should only be written when RXEN (ETHCON1<8>) is not set.

These bits are only used for Flow Control operations.

bit 15 **ON:** Ethernet ON bit

1 = Ethernet module is enabled
0 = Ethernet module is disabled

bit 14 **Unimplemented:** Read as '0'

1 = Ethernet module transfers are paused during Idle mode
0 = Ethernet module transfers continue during Idle mode

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **TXRTS:** Transmit Request to Send bit

1 = Activate the TX logic and send the packet(s) defined in the TX EDT
0 = Stop transmit (when cleared by software) or transmit done (when cleared by hardware)

After the bit is written with a '1', it will clear to a '0' whenever the transmit logic has finished transmitting the requested packets in the Ethernet Descriptor Table (EDT). If a '0' is written by the CPU, the transmit logic finishes the current packet's transmission and then stops any further.

This bit only affects TX operations.

bit 8 **RXEN:** Receive Enable bit(1)

1 = Enable RX logic, packets are received and stored in the RX buffer as controlled by the filter configuration
0 = Disable RX logic, no packets are received in the RX buffer

This bit only affects RX operations.

Note 1: It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ Feature
PLL Configuration	
The FNOSC<2:0> and NOSC<2:0> bits select between POSC and FRC. **FNOSC<2:0> (DEVCFG1<2:0>)** **NOSC<2:0> (OSCCON<10:8>)**	Selection of which input clock (POSC or FRC) is now done through the FPLLICLK/PLLICLK bits. **FPLLICLK (DEVCFG2<7>)** **PLLICLK (SPLLCON<7>)**
On PIC32MX devices, the input frequency to the PLL had to be between 4 MHz and 5 MHz. FPLLIDIV selected how to divide the input frequency to give it the appropriate range. FPLLIDIV<2:0> (DEVCFG2<2:0>) **111 = 12x divider** **110 = 10x divider** 101 = 6x divider 100 = 5x divider 011 = 4x divider 010 = 3x divider 001 = 2x divider 000 = 1x divider	On PIC32MZ devices, the input range for the PLL is wider (5 MHz to 64 MHz). The input divider values have changed, and new FPLLRNG/PLLRNG bits have been added to indicate under what range the input frequency falls. FPLLIDIV<2:0> (DEVCFG2<2:0>) **PLLIDIV<2:0> (SPLLCON<2:0>)** **111 = Divide by 8** **110 = Divide by 7** 101 = Divide by 6 100 = Divide by 5 011 = Divide by 4 010 = Divide by 3 001 = Divide by 2 000 = Divide by 1 **FPLLRNG<2:0> (DEVCFG2<6:4>)** **PLLRNG<2:0> (SPLLCON<2:0>)** **111 = Reserved** **110 = Reserved** **101 = 34-64 MHz** **100 = 21-42 MHz** **011 = 13-26 MHz** **010 = 8-16 MHz** **001 = 5-10 MHz** **000 = Bypass**
On PIC32MX devices, the output frequency of PLL is between 60 MHz and 120 MHz. The PLL multiplier and divider bits configure the PLL for this range. FPLLMUL<**2**:0> (DEVCFG2<**6:4**>) PLLMULT<**2**:0> (OSCCON<18:16>) **111 = 24x multiplier** **110 = 21x multiplier** **101 = 20x multiplier** **100 = 19x multiplier** **011 = 18x multiplier** **010 = 17x multiplier** **001 = 16x multiplier** **000 = 15x multiplier** FPLLODIV<2:0> (DEVCFG2<18:16>) PLLODIV<2:0> (OSCCON<29:27>) **111 = 24x multiplier** **110 = 21x multiplier** **101 = 20x multiplier** **100 = 19x multiplier** **011 = 18x multiplier** **010 = 17x multiplier** **001 = 16x multiplier** **000 = 15x multiplier**	The PLL multiplier and divider on PIC32MZ devices have a wider range to accommodate the wider PLL specification range of 10 MHz to 200 MHz.
