What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	16 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	15
Program Memory Size	32KB (11K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1K x 16
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 6x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SSOP (0.209", 5.30mm Width)
Supplier Device Package	28-SSOP

Note: Not all pins or features are implemented on all device pinout configurations. See the **"Pin Diagrams"** section for the specific pins and features present on each device.

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Type	Buffer Type	PPS	Description
AVDD	P	P	No	Positive supply for analog modules. This pin must be connected at all times. AVDD is connected to VDD in the 18-pin dsPIC33FJXXGP101 and 20-pin dsPIC33FJXXMC101 devices. In all other devices, AVDD is separated from VDD.
AVSS	P	P	No	Ground reference for analog modules. AVSS is connected to VSS in the 18-pin dsPIC33FJXXGP101 and 20-pin dsPIC33FJXXMC101 devices. In all other devices, AVSS is separated from VSS.
VDD	P	—	No	Positive supply for peripheral logic and I/O pins.
VCAP	P	—	No	CPU logic filter capacitor connection.
VSS	P	—	No	Ground reference for logic and I/O pins.

Legend: CMOS = CMOS compatible input or output; Analog = Analog input; P = Power

Note 1: An external pull-down resistor is required for the $\overline{\text{FLTA1}}$ pin in dsPIC33FJXXMC101 (20-pin) devices.

2: The $\overline{\text{FLTA1}}$ pin and the PWM1Lx/PWM1Hx pins are available in dsPIC(16/32)MC10X devices only.

3: The $\overline{\text{FLTB1}}$ pin is available in dsPIC(16/32)MC102/104 devices only.

4: The PWM Fault pins are enabled during any Reset event. Refer to **Section 15.2 “PWM Faults”** for more information on the PWM Faults.

5: Not all pins are available on all devices. Refer to the specific device in the **“Pin Diagrams”** section for availability.

6: These pins are available in dsPIC33FJ32(GP/MC)104 (44-pin) devices only.

4.6.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into any 16K word page of the program space. This option provides transparent access to stored constant data from the data space without the need to use special instructions (such as TBLRDL and TBLRDH).

Program space access through the data space occurs if the MSb of the data space EA is '1' and program space visibility is enabled by setting the PSV bit in the Core Control register (CORCON<2>). The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page register (PSVPAG). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits. By incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads to this area add a cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address, 0x8000 and higher, maps directly into a corresponding program memory address (see Figure 4-11), only the lower 16 bits of the 24-bit program word are used to contain the data. The upper 8 bits of any program space location used as data should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

Note:	PSV access is temporarily disabled during Table Reads/Writes.

For operations that use PSV and are executed outside a REPEAT loop, the MOV and MOV.D instructions require one instruction cycle in addition to the specified execution time. All other instructions require two instruction cycles in addition to the specified execution time.

For operations that use PSV, and are executed inside a REPEAT loop, these instances require two instruction cycles in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction using PSV to access data, to execute in a single cycle.

bit 15-8 **Unimplemented:** Read as ‘0’

bit 7-0 **NVMKEY<7:0>:** Key Register bits (write-only)

6.5 External Reset (EXTR)

The External Reset is generated by driving the MCLR pin low. The MCLR pin is a Schmitt trigger input with an additional glitch filter. Reset pulses that are longer than the minimum pulse width will generate a Reset. Refer to **Section 26.0 "Electrical Characteristics"** for minimum pulse-width specifications. The External Reset pin (MCLR) bit (EXTR) in the Reset Control (RCON) register is set to indicate the MCLR Reset.

6.5.1 EXTERNAL SUPERVISORY CIRCUIT

Many systems have external supervisory circuits that generate Reset signals to reset multiple devices in the system. This External Reset signal can be directly connected to the MCLR pin to reset the device when the rest of the system is reset.

6.5.2 INTERNAL SUPERVISORY CIRCUIT

When using the internal power supervisory circuit to reset the device, the External Reset pin (MCLR) should be tied directly or resistively to VDD. In this case, the MCLR pin will not be used to generate a Reset. The External Reset pin (MCLR) does not have an internal pull-up and must not be left unconnected.

6.6 Software RESET Instruction (SWR)

Whenever the RESET instruction is executed, the device will assert SYSRST, placing the device in a special Reset state. This Reset state will not re-initialize the clock. The clock source in effect prior to the RESET instruction will remain as the source. SYSRST is released at the next instruction cycle and the Reset vector fetch will commence.

The Software RESET (Instruction) Flag (SWR) bit in the Reset Control (RCON<6>) register is set to indicate the Software Reset.

6.7 Watchdog Timer Time-out Reset (WDTO)

Whenever a Watchdog Timer Time-out Reset occurs, the device will asynchronously assert SYSRST. The clock source will remain unchanged. A WDT time-out during Sleep or Idle mode will wake-up the processor, but will not reset the processor.

The Watchdog Timer Time-out Flag (WDTO) bit in the Reset Control (RCON<4>) register is set to indicate the Watchdog Timer Reset. Refer to **Section 23.4 "Watchdog Timer (WDT)"** for more information on the Watchdog Timer Reset.

6.8 Trap Conflict Reset

If a lower priority hard trap occurs while a higher priority trap is being processed, a hard Trap Conflict Reset occurs. The hard traps include exceptions of Priority Level 13 through Level 15, inclusive. The address error (Level 13) and oscillator error (Level 14) traps fall into this category.

The Trap Reset Flag (TRAPR) bit in the Reset Control (RCON<15>) register is set to indicate the Trap Conflict Reset. Refer to **Section 7.0 "Interrupt Controller"** for more information on Trap Conflict Resets.

6.9 Configuration Mismatch Reset

To maintain the integrity of the Peripheral Pin Select Control registers, they are constantly monitored with shadow registers in hardware. If an unexpected change in any of the registers occurs (such as cell disturbances caused by ESD or other external events), a Configuration Mismatch Reset occurs.

The Configuration Mismatch Flag (CM) bit in the Reset Control (RCON<9>) register is set to indicate the Configuration Mismatch Reset. Refer to **Section 10.0 "I/O Ports"** for more information on the Configuration Mismatch Reset.

Note:	The Configuration Mismatch feature and associated Reset flag is not available on all devices.

6.10 Illegal Condition Device Reset

An Illegal Condition Device Reset occurs due to the following sources:

- Illegal Opcode Reset
- Uninitialized W Register Reset
- Security Reset

The Illegal Opcode or Uninitialized W Access Reset Flag (IOPUWR) bit in the Reset Control (RCON<14>) register is set to indicate the Illegal Condition Device Reset.

6.10.1 ILLEGAL OPCODE RESET

A device Reset is generated if the device attempts to execute an illegal opcode value that is fetched from program memory.

The Illegal Opcode Reset function can prevent the device from executing program memory sections that are used to store constant data. To take advantage of the Illegal Opcode Reset, use only the lower 16 bits of each program memory section to store the data values. The upper 8 bits should be programmed with 0x3F, which is an illegal opcode value.

Note 1: Writes to this register require an unlock sequence. Refer to **"Oscillator (Part VI)"** (DS70644) in the *"dsPIC33/PIC24 Family Reference Manual"* for details.

2: Direct clock switches between any primary oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.

14.0 OUTPUT COMPARE

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Output Compare"** (DS70209) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The output compare module can select either Timer2 or Timer3 for its time base. The module compares the value of the timer with the value of one or two compare registers depending on the operating mode selected. The state of the output pin changes when the timer value matches the Output Compare Control register value. The output compare module generates either a single output pulse, or a sequence of output pulses, by changing the state of the output pin on the compare match events. The output compare module can also generate interrupts on compare match events.

The output compare module has multiple operating modes:

- Active-Low One-Shot mode
- Active-High One-Shot mode
- Toggle mode
- Delayed One-Shot mode
- Continuous Pulse mode
- PWM mode without Fault Protection
- PWM mode with Fault Protection

NOTES:

18.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note 1: This data sheet summarizes the features of the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"UART"** (DS70188) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the dsPIC33FJ16(GP/MC)101/102 and dsPIC33FJ32(GP/MC)101/102/104 device family. The UART is a full-duplex asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins, and also includes an IrDA® encoder and decoder.

The primary features of the UART module are:

- Full-Duplex, 8-Bit or 9-Bit Data Transmission through the UxTX and UxRX Pins
- Even, Odd or No Parity options (for 8-bit data)
- One or Two Stop bits
- Hardware Flow Control Option with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Pins
- Fully Integrated Baud Rate Generator with 16-Bit Prescaler
- Baud Rates Ranging from 1 Mbps to 6 bps at 16x mode at 16 MIPS
- Baud Rates Ranging from 4 Mbps to 24.4 bps at 4x mode at 16 MIPS
- 4-Deep First-In First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-bit mode with Address Detect (9th bit = 1)
- Transmit and Receive Interrupts
- A Separate Interrupt for all UART Error Conditions
- Loopback mode for Diagnostic Support
- Support for Sync and Break Characters
- Support for Automatic Baud Rate Detection
- IrDA® Encoder and Decoder Logic
- 16x Baud Clock Output for IrDA® Support

A simplified block diagram of the UART module is shown in Figure 18-1. The UART module consists of these key hardware elements:

- Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

SP51	TssH2doZ	$\overline{SSx}$ ↑ to SDOx Output High-Impedance	10	—	50	ns	See **Note 4**
SP52	TscH2ssH TscL2ssH	$\overline{SSx}$ after SCKx Edge	1.5 TCY + 40	—	—	ns	See **Note 4**

Note 1: These parameters are characterized, but are not tested in manufacturing.

2: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.

3: The minimum clock period for SCKx is 91 ns. Therefore, the SCKx clock generated by the Master must not violate this specification.

4: Assumes 50 pF load on all SPIx pins.

TABLE A-3: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 7.0 "Interrupt Controller"	Updated the Interrupt Vectors (see Table 7-1). The following registers were updated or added: • Register 7-5: IFS0: Interrupt Flag Status Register 0 • Register 7-11: IEC1: Interrupt Enable Control Register 1 • Register 7-21: IPC6: Interrupt Priority Control Register 6
Section 9.0 "Power-Saving Features"	Updated 9.5 PMD Control Registers.
Section 10.0 "I/O Ports"	Updated TABLE 10-1: Selectable Input Sources (Maps Input to Function)(1). Updated TABLE 10-2: Output Selection for Remappable Pin (RPn) The following registers were updated or added: • Register 10-4: RPINR4: Peripheral Pin Select Input Register 4 • Register 10-6: RPINR8: Peripheral Pin Select Input Register 8 • Register 10-19: RPOR8: Peripheral Pin Select Output Register 8 • Register 10-20: RPOR9: Peripheral Pin Select Output Register 9 • Register 10-21: RPOR10: Peripheral Pin Select Output Register 10 • Register 10-22: RPOR11: Peripheral Pin Select Output Register 11 • Register 10-23: RPOR12: Peripheral Pin Select Output Register 12
Section 12.0 "Timer2/3 and Timer4/5"	The features and operation information was extensively updated in support of Timer4/5 (see **Section 12.1 "32-Bit Operation"** and **Section 12.2 "16-Bit Operation"**). The block diagrams were updated in support of the new timers (see Figure 12-1, Figure 12-2, and Figure 12-3). The following registers were added: • Register 12-3: T4CON: Timer4 Control Register(1) • Register 12-4: T5CON: Timer5 Control Register(1)
Section 15.0 "Motor Control PWM Module"	Updated TABLE 15-1: Internal Pull-down resistors on PWM Fault pins. Note 2 was added to Register 15-5: PWMXCON1: PWMx Control Register 1(1).
Section 19.0 "10-Bit Analog-to-Digital Converter (ADC)"	The number of available input pins and channels were updated from six to 14. Updated FIGURE 19-1: ADC1 Block Diagram for dsPIC33FJXX(GP/MC)101 Devices. Updated FIGURE 19-2: ADC1 Block Diagram for dsPIC33FJXX(GP/MC)102 Devices. Added FIGURE 19-3: ADC1 Block Diagram for dsPIC33FJ32(GP/MC)104 Devices. The following registers were updated: • Register 19-4: AD1CHS123: ADC1 Input Channel 1, 2, 3 Select Register • Register 19-5: AD1CHS0: ADC1 INPUT Channel 0 select Register • Register 19-6: AD1CSSL: ADC1 Input Scan Select Register Low(1,2,3) • Register 19-7: AD1PCFGL: ADC1 Port Configuration Register Low(1,2,3)
